
JOINT INSTITUTE FOR NUCLEAR RESEARCH

TOPICAL PLAN
FOR JINR RESEARCH
AND INTERNATIONAL COOPERATION
2024

Dubna 2023

All the Themes in the Plan are listed by fields of research. Each Theme is coded according to the JINR system of classification and contains the following information:

the first number*	-	the field of research;
the second number **	-	the conventional number of Laboratory;
the third number	-	the theme's ordinal number;
the fourth and the fifth numbers	-	the years of the theme's activity's beginning and completion.

All the Projects (Subprojects) in the Plan are listed by Themes. Each Project (Subproject) is coded according to the JINR system of classification and contains the following information:

the first number*	-	the field of research;
the second number **	-	the conventional number of Laboratory;
the third number	-	the theme's ordinal number;
the fourth number	-	the project's (and subroject's) ordinal number;
the fifth and the sixth numbers	-	the years of the project's (subroject's) beginning and completion.

---

* 01 - Theoretical Physics
02 - Elementary Particle Physics and High-Enegry Heavy-Ion Physics
03 - Nuclear Physics
04 - Condensed Matter Physics
05 - Radiation Research in Life Sciences
06 - Information Technology
07 - Applied Innovation Activities
08 - Physics and Technology of Charged Particle Accelerators
09 - Organization of Scientific Activity and International Cooperation. Strengthening Human Resources. Educational Programme

** 1 - Veksler and Baldin Laboratory of High Energy Physics (VBLHEP)
2 - Dzhelepov Laboratory of Nuclear Problems (DLNP)
3 - Bogoliubov Laboratory of Theoretical Physics (BLTP)
4 - Frank Laboratory of Neutron Physics (FLNP)
5 - Flerov Laboratory of Nuclear Reactions (FLNR)
6 - Meshcheryakov Laboratory of Information Technologies (MLIT)
7 - Laboratory of Radiation Biology (LRB)
8 - Department of Science Organization Activities (DSOA)
9 - University Centre (UC)

N.A. Boklagova
D.S. Korobov

Contents

List of projects and subprojects included in JINR Topical Plan for 2024

[1] Participation in the DUNE experiment is temporarily suspended until further notice.

Large JINR Research Infrastructure

02-1-1065-2007/2026

NICA Complex: Design and Construction of the Complex of Accelerators, Collider and Physics Experimental Facilities at Extracted and Colliding Ion Beams Aimed at Studying Dense Baryonic Matter and the Spin Structure of Nucleons and Light Ions, and at Carrying out Applied and Innovation Projects

Leaders: V.D. Kekelidze
A.S. Sorin
G.V. Trubnikov

Deputies: A.V. Butenko
V.M. Golovatyuk
M.N. Kapishin

Participating countries and international organizations:
Armenia, Australia, Azerbaijan, Belarus, Bulgaria, CERN, Chile, China, Cuba, Czech Republic, Egypt, France, Georgia, Germany, Israel, Italy, Japan, Kazakhstan, Mexico, Moldova, Mongolia, Poland, Romania, Russia, Serbia, Slovakia, South Africa, Sweden, Ukraine, USA.

The problem under study and the main purpose of the research:
Search and investigation of phase transitions in strongly interacting nuclear matter at extremely high baryon densities, study of the nucleon spin structure, of light nuclei and polarization phenomena in few nucleon systems. Development of theoretical models of the studied processes and theoretical support of the experiments. Development of the Nuclotron accelerator complex as a basic facility for studying relativistic nuclear collisions in the range of atomic masses A = 1÷197. Investigation of reaction dynamics and studding modifications of hadron properties in nuclear matter, near-threshold strange hyperons production and search for hyper nuclei in interactions of the Nuclotron extracted ion beams with fixed targets at the BM@N detector. Development and stage-by-stage creation of the NICA heavy ion collider accelerator complex, the multi-purpose detector (MPD/NICA) and spin physics detector (SPD/NICA) for experiments with colliding heavy ions beams. Modernization of extraction beam lines. Carrying out of experiments with ion beams and polarized proton and deuteron beams at the Nuclotron. Development of the infrastructure for applied research at NICA heavy ion beams.

Projects:

	Name of the project	Project Leaders	Project code
1.	Nuclotron-NICA	A.V. Butenko G.G. Khodzhibagiyan *Scientific leader:* I.N. Meshkov	02-1-1065-1-2011/2023
2.	BM@N	M.N. Kapishin	02-1-1065-2-2012/2026
3.	MPD	V.M. Golovatyuk V.D. Kekelidze *Deputy:* V.G. Ryabov	02-1-1065-3-2011/2025
4.	SPD	A.V. Guskov *Deputy:* V.P. Ladygin	02-1-1065-4-2020/2024

Projects:

	Name of the project Laboratory (Subdivision)	Project Leaders Responsible from laboratories	Status
1.	**Nuclotron-NICA**	**A.V. Butenko** **G.G. Khodzhibagiyan** *Scientific leader:* **I.N. Meshkov**	
1.1.	**NICA injection complex: technical design preparation and construction of the NICA injection complex: (sources of heavy ions and polarized light nuclei, HILAC linear accelerators of heavy ions and light nuclei of beam transporting to the Nuclotron)**	**A.V. Butenko** **V.A. Monchinsky** **E.M. Syresin** **A.V. Tuzikov**	Realization
1.1.a.	**Commissioning of the heavy ion source (KRION)**	**E.E. Donets**	Realization
1.1.b.	**Upgrade the polarized proton and deuteron source (SPI)**	**V.V. Fimushkin** **R.A. Kuzyakin**	Realization
1.1.c.	**Development and construction of the beam injection systems and beam transportation channels. Development of the beam control and diagnostics systems**	**D.E. Donets** **E.V. Gorbachev** **A.V. Tuzikov**	Realization
1.1.d.	**Design and start of construction the new proton and light ion injector LILAC** VBLHEP	**A.V. Butenko** **K.A. Levterov** **B.V. Golovensky** **E.M. Syresin** V.P. Akimov, V.S. Brief annotation and scientific rationale:
The development and carryout works on of the existing infrastructure of the VBLHEP accelerator complex: HILAC, Booster, Nuclotron, beam transport channels in bldg. 1, bldg. 205 and new building 17 and other systems and new equipment required for the next stage commisionig of the NICA complex in 2025.

Expected results upon completion of the project:
The collider of the NICA complex ready for the launch in 2025.

Expected results of the project in the current year:
1. The development and carryout works on the HILAC, Booster and Nuclotron, as well as the existing beam transport channels of accelerator facility in bldg. 1 to bldg. 205, assembly of the start configuration and commissioning of the Nuclotron-Collider beam transport line in bldg. 1 and new building 17, assembly and commissioning of the fast extraction section from Nuclotron, assembly and commissioning sections for beam injection and beam dump in the Collider. Further development of the existing infrastructure for applied research on heavy ion beams. Preparation for the acceleration run in 2025.

2. Preparation of the equipment of the cryogenic complex for experiments on ion beams of the accelerator complex in 2024. Commissioning at the cryogenic compressor station. Start-up and commissioning of two Collider refrigerators in new building 17. Start-up and adjustment work on the equipment of the nitrogen system of the VBLHEP cryogenic complex.

2.	**BM@N**	**M.N. Kapishin**	Realization
2.1.	**Development of the operational area of the setup: increasing the radiation protection, improving detector subsystems and engineering infrastructure**	**S.Yu. Anisimov** **M.N. Kapishin** **S.M. Piyadin**	Realization
2.2.	**Construction of the basic detector complex of the BM@N setup**	**M.N. Kapishin** **S.M. Piyadin**	Realization
2.3.	**Development of the technological and engineering systems, control systems and test areas of the setup**	**S.Yu. Anisimov** **S.M. Piyadin** **N.D. Topilin**	Realization

2.4.	**Analysis of BM@N experimental data and feasibility studies for BM@N program in heavy ion beams**	**M.N. Kapishin** **A.I. Zinchenko**

Realization

Brief annotation and scientific rationale:
Investigation of reaction dynamics and studingmodifications of hadron properties in nuclear matter, near-threshold strange hyperons production and search for hyper nuclei in interactions of the Nuclotron extracted ion beams with fixed targets at the BM@N detector.

Expected results upon completion of the project:
Commissioning of BM@N and obtaining physics results on interactions of Nuclotron extracted ion beams with fixed targets to study reaction dynamics and the equation-of-state of nuclear matter, modifications of hadron properties in nuclear matter, near-threshold strange hyperons production and to search for hyper nuclei.

Expected results of the project in the current year:
Preparing the BM@N set-up for the physics run with a heavy ion beam extracted from the Nuclotron. New data collection with a heavy ion beam at BM@N. Analysis of new experimental data collected at BM@N.

Brief annotation and scientific rationale:
The MPD experiment at the NICA collider is designed to study collisions of relativistic heavy nuclei in the energy range = 4-11 GeV. The physical program of the experiment is aimed at studying the structure of the phase diagram of the state of strongly interacting matter in the region of moderate temperatures and large baryon densities exceeding the density in ordinary nuclear matter by 5-8 times. At the same time, much attention is also paid to the issue of searching for parton degrees of freedom and critical signatures in the resulting system using various physical observables. In order to carry out these studies, the detectors of the experimental setup must ensure effective registration and identification of various particles born in collisions of nuclei and measurement of their parameters at high loads in a wide range of phase space.

Expected results upon completion of the project:
1. Creating and launching the first stage of the MPD experimental setup.
   The configuration of the first stage includes: a magnet that creates a uniform field up to 0.57T, a track system based on the time projection chamber TPC, a time-of-flight detector FFD-TOF, an electromagnetic calorimeter ECal and a forward hadron calorimeter FHCal. Holding a technical run on the beams of the NICA collider to configure all subsystems of the MPD experimental setup, holding a physical run on the beam for a set of events corresponding to collisions of heavy ions in the required beam configuration in order to study the properties of baryonic matter.

2. Creation and commissioning of a centralized data processing system running in the MpdRoot software environment and providing: 1) calibration of data received from the MPD experimental setup, 2) primary processing of data received from the experimental setup to switch from the raw data format to tables of recovered tracks and hits in detector subsystems, 3) processing of the tables of tracks and hits obtained at the previous stage in order to obtain the first high-quality physical results.

Expected results of the project in the current year:
1. Cooling of the Solenoid to the temperature of liquid nitrogen, completion of the creation of TOF, FHCal, FFD subsystems, assembly of the TPC housing, manufacture and testing of 80% of all ECal modules.

2. Creation and commissioning of a centralized data processing system, known as “Analysis Train”, for processing simulated data in order to study the possibilities of the MPD experimental setup for studying various physical signals.

3. Simulation of the operation of the MPD experimental setup in A+A collisions using various event generators in order to study the possibilities of its use for studying collisions of an ion beam with a fixed target. Such a configuration makes it possible to expand the area of the studied interaction energies of nuclei to an energy of ~ 2 GeV and provide the necessary frequency of nuclear collisions at almost any achieved beam luminosity.

4. SPD:
Conceptual and technical design of the Spin Physics Detector (SPD) at the NICA collider

Brief annotation and scientific rationale:
The Spin Physics Detector is a planned experimental setup at the NICA collider is intended to study the spin structure of the proton and deuteron and the other spin-related phenomena with polarized proton and deuteron beams at a collision energy up to 27 GeV and a luminosity up to 10^{32} cm^{-2} s^{-1}. In the polarized proton-proton collisions, the SPD experiment will cover the kinematic gap between the low-energy measurements at ANKE-COSY and SATURNE and the high-energy measurements at the Relativistic Heavy Ion Collider, as well as the planned fixed-target experiments at the LHC. As for the possibility for NICA to operate with polarized deuteron beams at such energies, it is unique. SPD is planned to operate as a universal facility for comprehensive study of the unpolarized and polarized gluon content of the nucleon at large and moderate x, using different complementary probes such as: charmonia, open charm, and prompt photon production processes. A priority of the experiment is the measurement of parton distributions depending on the transverse momentum of partons in the nucleon (TMD PDFs). The study of spin effects in the elastic scattering of protons and deuterons, and in the production of lambda-hyperons, search for dibaryon resonances, study of the charmed particles production near threshold, study of multiquark correlations, and other polarized and unpolarized physics will be available at the first stage of the collider operation with reduced luminosity and collision energy of proton and ion beams.

Expected results upon completion of the project:
The main result of the experiment should be new information on the gluon helicity, gluon Sivers, Boer-Mulders and other Transverse Momentum Dependent PDFs in the nucleon, as well as the gluon transversity distribution and tensor PDFs in the deuteron, via the measurement of specific single and double spin asymmetries. The results expected to be obtained by SPD will play an important role in the general understanding of the properties of strong interaction, specifically, of the nucleon gluon content and will serve as a complementary input to the ongoing and planned studies at RHIC, and future measurements at the EIC (BNL) and fixed-target facilities at the LHC (CERN). Simultaneous measurement of the same quantities using different processes at the same experimental setup is of key importance for minimization of possible systematic effects.

Expected results of the project in the current year:
1. Design, development, testing and optimization of prototypes of the detectors and other subsystems of the SPD setup.
2. Creation and development of infrastructure for testing prototypes of the SPD subsystems at the Nuclotron beams.
3. Finalization of the SPD technical design report. Approval of the technical design by the SPD International Advisory Committee.

Baikal Deep Underwater Gigaton Volume Neutrino Telescope (Baikal-GVD)

Leader: I.A. Belolaptikov

Deputy: S.V. Rozov

Participating countries and international organizations:
Czech Republic, Kazakhstan, Russia, Slovakia.

The problem under study and the main purpose of the research:
Implementation of the project that includes the modernization and development of the Baikal deep-water detector up to a detection volume of 1 km^3 in studies of high-energy neutrino fluxes of astrophysical origin.

Project:

MLIT	M.S. Katulin, A.G. Soloviev	

Brief annotation and scientific rationale:
Baikal-GVD project is further development of gigaton volume neutrino telescope for research in the field of multichannel astronomy, study of the fundamental properties of the most energetic cosmic neutrinos, indirect search for galactic “dark” matter and applied research. The Baikal-GVD Collaboration is constructing a neutrino telescope in Lake Baikal. Arrays of light-sensitive elements record the Čerenkov light produced by fast travelling charged particles in the lake water, these particles could originate from interactions of neutrinos. The energy and direction of the original neutrinos reconstructed from the amount of Čerenkov photons and their time-of-arrival in the detector. The telescope is measuring cosmic neutrinos and searching for their sources as well as possible neutrino flux from Dark Matter annihilation and other rare phenomena. The scientific program of the project will be focused on fundamental problems of astrophysics and elementary particle physics: identification of astrophysical sources of ultrahigh-energy neutrinos, mechanisms of formation and evolution of galaxies, neutrino geophysics, etc. In particular, mapping the high-energy neutrino sky in the Southern Hemisphere including the region of the galactic center considering as a nearest aim. Other topics include indirect search for dark matter by detecting neutrinos produced in WIMP annihilation in the Sun or in the center of the Earth. Baikal-GVD will also search for exotic particles like magnetic monopoles, super-symmetric Q-balls or nuclearites.

Expected results upon completion of the project:
Creation of a deep-sea neutrino telescope on a scale of 1 km^3 on Lake Baikal. Study of high-energy neutrino fluxes from space, search for hypothetical particles-magnetic monopoles, as well as particles - candidates for the role of dark matter. A large volume of detection in combination with a high angular and energy resolution and moderate background conditions typical of fresh water make it possible to conduct effective studies of the diffusive neutrino flux and fluxes from individual astrophysical objects with constant and variable luminosity.

Expected results of the project in the current year:
Data taking on the installed twelve clusters of the Baikal-GVD neutrino telescope. Search for and study of high-energy neutrinos of astrophysical nature. Preparation and deployment of the following detector clusters. Development and testing of a new data acquisition system, allowing a decrease in the threshold of detected energies.

Multifunctional Information and Computing Complex (MICC)

Leaders: V.V. Korenkov
S.V. Shmatov

Deputies: A.G. Dolbilov
D.V. Podgainy
T.A. Strizh

Participating Countries and International organizations:
Armenia, Azerbaijan, Belarus, Bulgaria, CERN, China, Egypt, France, Georgia, Italy, Kazakhstan, Mexico, Moldova, Mongolia, Russia, Slovakia, South Africa, Taiwan, USA, Uzbekistan.

The problem under study and the main purpose of the research:
The main objective of the MICC is to meet the needs of the JINR scientific community to the maximum extent possible in order to solve urgent tasks, from theoretical research and experimental data processing, storage and analysis to the solution of applied tasks in the field of life sciences. The tasks of the NICA project, the neutrino programme, the tasks of processing data from the experiments at the LHC and other large-scale experiments, as well as support for users of the JINR Laboratories and its Member States will be the priorities.

The project presupposes the inclusion of two activities, which, like the project, are aimed at meeting the requirements of a large number of research and administrative personnel:

1. development of the digital platform "JINR Digital EcoSystem", which integrates existing and future services to support scientific, administrative and social activities, as well as to maintain the engineering and IT infrastructures of the Institute, which in turn will provide reliable and secure access to different types of data and enable a comprehensive analysis of information using modern technologies of Big Data and artificial intelligence.
2. creation of a multi-purpose hardware and software platform for Big Data analytics based on hybrid hardware accelerators; machine learning algorithms; tools for analytics, reports and visualization; support of user interfaces and tasks.

Brief annotation and scientific rationale:
To attain the major goals of JINR's flagship projects, it will be required to process a huge amount of experimental data. According to a very rough estimate, these are tens of thousands of processor cores and hundreds of petabytes of experimental data. The experiments of the NICA project and the JINR neutrino programme (Baikal-GVD, JUNO, etc.) entail Tier0, Tier1 and Tier2 grid infrastructures. To achieve these goals, it is essential to develop distributed multi-layer heterogeneous computing environments, including on top of the resources of the participants of other projects and collaborations.

The concept of the development of information technology, scientific computing and Data Science in the JINR Seven-Year Plan provides for the creation of a scientific IT infrastructure that combines a multitude of various technological solutions, trends and methods. The IT infrastructure implies the coordinated development of interconnected IT technologies and computational methods aimed at maximizing the number of JINR strategic tasks to be solved that require intensive data computing. The large research infrastructure project "Multifunctional Information and Computing Complex" holds a special place in this concept.

The MICC main objective for 2024-2030 is to perform a set of actions aimed at the modernization and development of the major hardware and software components of the computing complex, the creation of a state-of-the-art software platform enabling the solution of a wide range of research and applied tasks in accordance with the JINR Seven-Year Plan. The rapid development of information technology and new user requirements stimulate the development of all MICC components and platforms. The MICC computing infrastructure encompasses four advanced software and hardware components, namely, the Tier1 and Tier2 grid sites, the hyperconverged "Govorun" supercomputer, the cloud infrastructure and the distributed multi-layer data storage system. This set of components ensures the uniqueness of the MICC on the world landscape and allows the scientific community of JINR and its Member States to use all progressive computing technologies within one computing complex that provides multifunctionality, scalability, high performance, reliability and availability in 24x7x365 mode with the multi-layer data storage system for different user groups.

Within the MICC, it is provided to support the operation of all MICC hardware and software components, i.e., the Tier1 and Tier2 grid sites, the cloud infrastructure, the hyperconverged "Govorun" supercomputer, the multi-layer data storage system, the network infrastructure, the power supply and climate control systems, as well as to modernize/reconstruct the above components in accordance with new trends in the development of IT technologies and user requirements. In addition, it is required to ensure high-speed telecommunications, a modern local area network infrastructure and a reliable engineering infrastructure that provides guaranteed power supply and air conditioning for the server equipment.

Expected results upon completion of the project:
1. Modernization of the JINR MICC engineering infrastructure (reconstruction in accordance with modern requirements of the machine hall of the 4th floor of MLIT).
2. Modernization and development of the distributed computing platform for the NICA project with the involvement of the computing centres of the NICA collaboration.

3. Creation of a Tier0 grid cluster for the experiments of the NICA megaproject to store experimental and simulated data. Expansion of the performance and storage capacity of the Tier1 and Tier2 grid clusters as data centres for the experiments of the NICA megaproject, the JINR neutrino programme and the experiments at the LHC.
4. Enlargement of the JINR cloud infrastructure to broaden the range of services provided to users on the basis of containerization technologies. Automation of the deployment of cloud technologies in the JINR Member States' organizations.
5. Expansion of the HybriLIT heterogeneous platform, including the "Govorun" supercomputer, as a hyperconverged software-defined environment with a hierarchical data storage and processing system.
6. Design and elaboration of a distributed software-defined high-performance computing platform that combines supercomputer (heterogeneous), grid and cloud technologies for the effective use of novel computing architectures.
7. Development of a computer infrastructure protection system based on fundamentally new paradigms, including quantum cryptography, neurocognitive principles of data organization and data object interaction, global integration of information systems, universal access to applications, new Internet protocols, virtualization, social networks, mobile device data and geolocation.

Expected results of the project in the current year:

1. Maintenance of the stable, safe and integral functioning of the JINR information and telecommunication network (backbone network (2x100 Gbps); the transport network of the NICA megaproject (4x100 Gbps); the MLIT mesh network (100 Gbps); backbone external telecommunication channels (3x100 Gbps); the Wi-Fi network at the Institute's sites in 24x7x365 mode. Support of standard network services: email (SMTP, IMAP, POP3, WebMail), file sharing (ftp, scp, sftp, http, https), security (ssh, https, TACACS authentication, dns, SSO), user database support, IPDB network element database support, etc.
2. Maintenance and operation of the full-scale and optimal functioning of the guaranteed power supply (diesel generators, uninterruptible power supplies) and climate control systems (chillers, dry coolers, inter-row air conditioners, etc.) of the MICC computing infrastructure in 24x7x365 mode. Commissioning of a new fire safety system of the MICC infrastructure. Project elaboration and start of modernization of the server room in the hall of the 4th floor of the MLIT building.
3. Expansion of the performance and storage system of the MICC basic components, namely, the Tier1 centre up to 22,000 CPU cores and 14,500 TB, Tier2/CICC up to 11,000 CPU cores, the EOS system up to 27 PB. Enlargement of the total volume of the robotic tape storage up to 70 PB. Support and maintenance of user work with the EOS system. Support of the system of access to the home directories of JINR users (AFS). Development and support of the unified storage and access system for common software (CVMFS). Support of the software system for working with tape robots (CTA). Creation and update of a polygon for debugging and testing new software for the MICC uppermost components. Support and maintenance of the operation of WLCG virtual organizations, the NICA, COMPASS, NOvA, ILC and other experiments, local user groups on the MICC Tier1 and Tier2 resources.
4. Extension of the number of users and participants of the distributed information and computing environment (DICE) on the basis of the cloud resources of the JINR Member States' organizations. Development of tools for the functional monitoring of cloud resources connected to the DICE. Enlargement of the resources of the MICC cloud, including at the expense of the resources acquired by the Baikal-GVD, JUNO, NOvA/DUNE experiments, and their maintenance. Migration of the server operating systems (OS) of all components of the JINR cloud, as well as HTCondor and JupyterHub virtual clusters deployed in the cloud, to a new OS due to the end of the lifespan of CentOS Linux 7 in June 2024. Development and implementation of the JupyterHub cluster monitoring system. Implementation of the HTCondor cluster monitoring system based on the htcondor-exporter metrics collector of own design.
5. Transition to a new version of DIRAC: DIRAC 8. Development and implementation of a system for analysing the performance of resources integrated into the DIRAC-based distributed heterogeneous computing environment. Development of tools and approaches to data transfer monitoring.
6. Development of a distributed system for storing and processing hot data under the management of parallel low-latency file systems (Luster/BeeGFS), as well as the DAOS distributed data storage, and introduction of this system to the hierarchical data processing and storage structure of the "Govorun" supercomputer and the NICA offline cluster to model and reconstruct events for the NICA experiments.
7. Putting into trial operation the components of the prototype of a data processing system in the distributed computing environment for the SPD experiment (SPD offline computing). Trial operation of the data management system and testing of its interaction with the data processing management system. Development of specialized services typical for Tier0 centers.
8. Development and support of the current MICC monitoring and accounting system, inclusion of monitoring the parameters of new computing and engineering elements in the list of monitored services and hardware. Development of new scripts to automate data acquisition processes. Creation of a script of data transfer failure notification for the dCache file system. Within the creation of a control room for engineering systems (power supply and climate control systems), special information displays with schematic representations of these systems will be elaborated. Development of analytical systems capable of notifying of the most critical issues of the MICC in real time.

Activities:

	Name of the activity	Leaders	Implementation period
	Laboratory (Subdivision)	Responsible from laboratories	
1.	**JINR Digital EcoSystem**	**V.V. Korenkov** **S.D. Belov**	2024-2026
	MLIT	N.A. Balashov, N.E. Belyakova, O.V. Belyakova, A.S. Bondyakov, N.A. Davydova, I.A. Filozova, L.A. Kalmykova, E.N. Kapitonova, A.O. Kondratiev, E. S. Kuznetsova, E.K. Kuzmina, S.V. Kunyaev, L.D. Kuchugurnaya, I.K. Nekrasova, M.M. Pashkova, L.V. Popkova, A.V. Prikhodko, T.F. Sapozhnikova, V.S. Semashko, S.V. Semashko, I.A. Sokolov, E.V. Sheiko, G.V. Shestakova, T.S. Syresina, D.Yu. Usov, P.V. Ustenko, T.N. Zaikina	
	VBLHEP	V.V. Morozov, I.V. Slepnev, A.V. Trubnikov	
	DSDD	A.V. Sheiko	

Brief annotation and scientific rationale:

The activity is related to the creation of an Institute-wide digital platform "JINR Digital EcoSystem". The main objective is the organization of a digital space with a single access and data exchange between electronic systems, as well as the transition of actions that previously required a personal or written request to a digital form. The platform is designed to ensure the integration of existing and future services to support scientific, administrative and social activities, as well as to maintain the engineering and IT infrastructures of the Institute.

Within the activity, two main directions of work are planned: the creation of the basic infrastructure of the digital platform (including the software-hardware and methodological support of its functioning) and different digital services. In addition to service support, digital services for scientific collaborations, whose activity is related to JINR's basic facilities, will be developed and maintained for use by the Institute's staff members.

Expected results upon completion of the activity:

1. Creation of a hardware-software and methodological basis for the functioning of the Institute-wide digital platform.
2. Development and implementation of digital services for distributed access to resources (information, computing, administrative, organizational ones) in a unified environment.
3. Transition of the processes of getting permits, approvals and applications of different types into a digital form.
4. Creation of a catalogue and a distributed storage of data related to the scientific and technical aspects of the Institute's activity, as well as of tools for their analysis, presentation and the construction of predictive models

Expected results in the activity in the current year:

1. Creation and mutual integration of existing basic digital infrastructure services: authentication, management and control of roles and access rights, data exchange bus, notification system, automated data catalogue, distributed storage.
2. Commissioning of the ecosystem's user interface, including mechanisms and methods for integrating services into it, the organization of feedback from users on the basis of electronic requests, a system of notifications and alerts. Development of administrative mechanisms for maintaining the functioning of the DES, including the distribution of roles and responsibilities, as well as coordination chains for services and the DES as a whole. Creation of a set of specifications and programme templates for developers of digital services.
3. Putting into trial operation a prototype of a service of the institutional repository of JINR staff members' publications, which enables to create and update data on the profile of the author and structural subdivisions, to receive bibliographic metadata from external sources, to upload metadata to the repository in automatic mode with reference to authors' profiles.
4. Putting into trial operation a prototype of a service for storing scientific documentation, which provides the possibility of centralized storage and exchange of different types of documentation between users of the system. Transition to the service and integration of data from existing outdated disparate databases of scientific documentation.
5. Current maintenance and development of the "Dubna" EDMS, including the creation of a subsystem for the archival storage of documents, the elaboration of new electronic documents and reports and modification of existing ones in accordance with the Institute's orders and user requests, the expansion of the scope of the "Dubna" EDMS for getting permits, approvals and applications of different types.

6. The following features will be implemented in the geoinformation system to support JINR's technological services: accounting of engineering networks of different types with all the necessary attributes, land plots, real estate objects, landscaping and the infrastructure, linking of electronic documents (schemes, photos, etc.) to objects and information about ongoing works (reconstruction, repairs, etc.) with reference to time. Implementation of the possibility of editing the geometry of objects and their attributes, creating new objects. Creation of a role model for differentiating access to information on objects.

2. The multi-purpose hardware and software platform for Big Data analytics — **P.V. Zrelov** — 2024-2026

MLIT — S.D. Belov, I.A. Filozova, Yu.E. Gavrilenko, A.V. Ilyina, I.A. Kashunin, M.A. Matveev, I.S. Pelevanyuk, R.N. Semenov, T.M. Solovieva, E.V. Sheiko, V.A. Tarabrin, T.N. Zaikina, D.P. Zrelova

Brief annotation and scientific rationale:

The activity provides for the creation of a multi-purpose hardware and software platform for Big Data analytics, which implements a full cycle of continuous processing, from data acquisition to the visualization of processing and analysis results, forecasts, recommendations and instructions, within the JINR MICC. One of the tasks planned to be solved using the platform is the elaboration of an analytical system for managing the MICC resources and data flows to enhance the efficiency of using computing and storage resources and optimize experimental data processing, as well as the development of the intelligent monitoring of distributed computing systems and data centres. Another essential task is the creation and development of analytics tools for the services of the JINR Digital EcoSystem.

Expected results upon completion of the activity:

1. Creation of a universal core of a Big Data mining platform.
2. Development and implementation of a number of standard software solutions for different classes of tasks within the platform.
3. Elaboration and development of analytics tools for the JINR Digital EcoSystem.
4. Development of methods and creation of complex solutions for analysing the security of data and computer systems.
5. Development of artificial intelligence methods within the analytical platform and creation of a software environment for work with technical and scientific information.
6. Elaboration of common solutions based on Big Data analytics for expert and recommendation systems, including for the optimization of the processes of functioning of the MICC components.

Expected results of the activity in the current year:

1. Creation of a prototype of an infrastructure and a software-analytical platform for Big Data.
2. Methodology for the analysis of streaming data with a high arrival rate.
3. Elaboration of intelligent data marts based on the Big Data approach.

03-5-1129-2017/2028

Development of the FLNR Accelerator Complex and Experimental Setups (DRIBs-III)

Leaders: I.V. Kalagin
S.I. Sidorchuk

Deputies: V.A. Semin
A.V. Yeremin

Scientific leader: Yu.Ts. Oganessian

Participating countries and international organizations:
China, Egypt, Kazakhstan, Mongolia, Russia, Serbia, South Africa, India.

The problem under study and the main purpose of the research:
The implementation of the DRIBs-III project that includes the upgrade and development of the FLNR cyclotron complex, expansion of the experimental infrastructure of the Laboratory (construction of new physics set-ups), and the development of accelerator systems. The project aims at improving the operation stability of accelerators, increasing the intensity and improving the quality of ion beams of stable and radioactive nuclides in the energy range from 5 to 100 MeV/nucleon, while at the same time reducing power consumption. The project objective is to significantly improve the efficiency of experiments on the synthesis of superheavy elements and light nuclei at nucleon drip lines and study their properties. Moreover, the programme of experiments with beams of radioactive nuclides is anticipated to be expanded.

In addition, the construction of the DC-140 cyclotron for applied research and commissioning work have continued. The work is carried out under "The project for the creation of the JINR Innovation Research Center" as part of "The FLNR research complex for materials science" project.

Within the theme quite as important are the support of physics experiments and the development of existing accelerators and experimental set-ups.

Projects:

Brief annotation and scientific rationale:
The goal of the project is the construction of the U-400R accelerator complex for the detailed study of the mechanisms of nuclear reactions with stable heavy-ion beams (fusion–fission, quasifission, multinucleon transfer, etc.), synthesis of new nuclides in these reactions, and decay spectroscopy of nuclei under investigation.

The project encompasses such tasks as the construction of a new experimental hall, the upgrade of the U-400 cyclotron (U-400R following the modernization), and the construction of new separators and ion-guide systems for beam transport.

The accelerator complex will be used for the detailed study of the properties of the isotopes of heavy and superheavy elements and in searches for novel methods of synthesizing heavy nuclides. The studies do not imply the use of radioactive target materials in amounts exceeding 10^5Bq.

Expected results upon completion of the project:
1. Upgrade of the U-400 cyclotron (U-400R after the upgrade).
2. Construction of a new experimental hall of U-400R.
3. Construction of new experimental set-ups and beam transport channels from U-400R.
4. Continuation of the construction and work on commissioning the DC-140 cyclotron for applied research.

Expected results of the project in the current year:
1. Completion of the upgrade and commissioning of the U-400M cyclotron. Enabling first experiments.
2. Development of the infrastructure of the ACCULINNA-2 fragment separator (RF kicker, tritium target complex).
3. Implementation of the experimental programme at the U-400 cyclotron.
4. Construction of the U-400R experimental hall.
5. Start of the reconstruction of the U-400 (U-400R) cyclotron.
6. Development of a design of the kinematic separator of multinucleon transfer reaction products.
7. Development of the design concepts of the SCIF-D set-up for studying nuclear reaction mechanisms.
8. Construction of the DC-140 cyclotron.
9. Development of methods for beam diagnostics of stable and radioactive nuclides.
10. Test launching of the cryogenic gas ion catcher.
11. Development of the MAVR spectrometer systems.

2. Development of the experimental setups to study the chemical and physical properties of superheavy elements

Brief annotation and scientific rationale:
Nowadays acceleration of high-intensity beams at the DC-280 cyclotron (SHE Factory) provides sufficient statistics in experiments on the synthesis of superheavy nuclei in the vicinity of the island of stability (Z=114, N=184), thereby opening up new avenues for research. Among the new opportunities the SHE Factory offers are studies of the chemical properties of short-lived ($T_{1/2}$<0.5 s) isotopes of superheavy elements and precise measurements of their masses.

The project aims to create novel state-of-the-art experimental instruments. Experimental set-ups to be installed at the DC-280 cyclotron will be used for synthesizing and studying the physical and chemical properties of the isotopes of heavy and superheavy elements as well as in studies of nuclear reaction mechanisms, in nuclear spectrometry and mass spectrometry. To attain these goals, we are planning to construct a new superconducting gas-filled GASSOL separator and a multi-reflection time-of-flight mass spectrometer.

The magnetic gas-filled separator (GASSOL), whose key element is a superconducting solenoid magnet, is intended for studying the physical and chemical properties of superheavy elements, including their short-lived ($T_{1/2}$< 0.5 c) isotopes, thereby establishing a pathway to elements heavier than Fl. In addition to efficient separation of reaction products, the separator will focus nuclei of interest into a spot not exceeding 1 cm in diameter.

The specialized high-resolution mass spectrometer is designed for measuring the masses of superheavy elements with Z=104–118 and A=266–294 and their radioactive decay products with an accuracy of <100 keV. Its principle of operation is based on the multi-reflection time-of-flight (MR TOF) technique.

Expected results upon completion of the project:

1. Development of methods for producing intensive beams of ^{48}Ca, ^{50}Ti, ^{54}Cr, etc.
2. Assembly of the solenoid magnet of the superconducting gas-filled GASSOL separator.
3. Construction of a multi-reflection time-of-flight mass spectrometer.

Expected results of the project in the current year:

1. Enabling experiments on the synthesis of superheavy elements and study of their properties at the Superheavy Element Factory.
2. Construction of the GASSOL separator for radiochemical studies of superheavy elements.

Pulsed Neutron Source and the Complex of Spectrometers

Leader: E.V. Lychagin

Participating countries and international organizations:
Argentina, Armenia, Azerbaijan, Belarus, Bulgaria, China, Cuba, Czech Republic, Egypt, France, Germany, Hungary, IAEA, India, Italy, Japan, Kazakhstan, Latvia, Mongolia, Poland, Romania, Russia, Serbia, Slovakia, South Africa, Spain, Sweden, Switzerland, Tajikistan, USA, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:
Revealing the relationships between the structural features of materials and their physical properties at the microscopic level is one of the fundamental tasks that determine the development of modern concepts in the field of condensed matter physics, materials science, chemistry, geophysics, engineering, biology and pharmacology. The unique advantages of using neutron research methods make their application the most optimal, and in some cases the only approach for solving a wide range of topical fundamental and applied problems. For the successful implementation of the neutron research program, it is of utmost importance to support and develop large infrastructures, encompassing the neutron source and the suite of spectrometers.
The main task of the project for the development of the existing neutron source is to increase the efficiency in the use of the IBR-2 research nuclear facility for implementation of the program of experimental investigations, to ensure operational reliability and safety of the reactor. Regular operation of the IBR-2 research nuclear facility is carried out in accordance with the Rostekhnadzor license with an average power of up to 2 MW. The IBR-2 facility is equipped with modern safety control systems, systems of analysis and diagnostics of the reactor state, systems for radiation monitoring and control of radiation situation.

The main objective of the project for the development of the complex of spectrometers is the continuous improvement of experimental techniques available to the scientists. It is achieved mostly through increasing the number of controlled parameters, number of detectors, and sample environment systems used in the experiment. The quality is enhanced also by their sophistication, heightened requirements for accuracy and operation speed of data acquisition equipment, necessity to provide remote control over spectrometer subsystems and the experiment. The user policy carried out at the IBR-2 spectrometers imposes additional requirements for the equipment of the spectrometers, control systems, and data acquisition systems, which should be easy to master and easy to use, should have convenient graphic interface and provide access to measurement results via the Internet.

The development of the concept of the new pulsed fast reactor was included in the JINR Seven-Year Development Plan for 2017–2023, which is of key significance for the successful continuation of the neutron-based research program after the end of the IBR-2 service life. Based on the results of joint research work of JINR and JSC NIKIET (Rosatom State Corporation), which consisted in analyzing variants of a high-flux pulsed neutron source, the concept of the NEPTUN pulsed fast reactor with neptunium-nitride fuel was chosen for further elaboration. The main stages of the development of the concept of the new NEPTUN reactor include: development of a preliminary scientific program and determination of the composition of a suite of scientific instruments for conducting neutron research, development of technical specifications for preliminary design and infrastructure projects, scientific and technical rationale for the design of the new neutron source, as well as the implementation of the research and development program, which includes the study of the dynamics of pulsed reactors, optimization of the design of the main reactor systems, development of neptunium-nitride fuel and neptunium-nitride-based fuel rods, optimization of the configuration of the moderator complex, development of prototypes or special test stands.

Project/Subprojects:

Name of the project/subprojects Laboratory (Subdivision)	**Project/Subprojects Leaders** Responsible from laboratories	**Status**
1. Development of the IBR-2 nuclear facility with a complex of cryogenic moderators	**A.V. Vinogradov** **A.V. Dolgikh**	Realization
FLNP	A.A. Belyakov, D.Yu. Denisenko, V.A. Krivov, S.A. Magerramova, Yu.N. Pepelyshev, Yu.M. Slotvitsky, L.A. Tayybon + 50 engineers, + 40 workers	

Brief annotation and scientific rationale:
The main task of the project is to increase the efficiency in the use of the IBR-2 research nuclear facility for implementation of the program of experimental investigations, to ensure operational reliability and safety of the reactor.

Regular operation of the research nuclear facility IBR-2 is carried out in accordance with the Rostekhnadzor license with an average power of up to 2 MW to provide neutron beams for conducting physics experiments The IBR-2 facility is equipped with modern safety control systems, systems of analysis and diagnostics of the reactor state, systems for radiation monitoring and control of radiation situation.

Expected results upon completion of the project:
After completion of work on the subproject, JINR will continue to operate a world-class high-flux neutron source for research in the field of condensed matter physics and nuclear physics – the IBR-2 research nuclear facility of advanced safety and reliability. The suite of equipment of the IBR-2 will comprise:

1. cryogenic moderators that ensure the implementation of a cutting-edge and competitive program of physics research.
2. advanced equipment for safety-related systems of the IBR-2.
3. reserve movable reflector MR-3R, which will be fully prepared for operation to ensure guaranteed functioning of the IBR-2 nuclear facility.

Expected results of the project in the current year:

1. Obtaining a license from Rostekhnadzor for the right to operate IBR-2.
2. Check assembly, adjustment and trials of the MR-3R reserve movable reflector at the FLNP test stand.

3. Phased replacement and upgrading of the IBR-2 basic technological and electrical equipment, which is important for the safe operation of the IBR-2 nuclear facility.
4. In cooperation with the Mayak Production Association, working out and consideration of the possibility of manufacturing and supplying an additional batch of fresh fuel for the IBR-2 core in order to extend the service life of the reactor for physics experiments until 2040-2042.

Subproject:

1.1. Construction of a complex of cryogenic moderators	**A.A. Belyakov** **M.V. Bulavin**	Realization
FLNP	A.V. Dolgikh + 16 engineers, + 40 workers	

Brief annotation and scientific rationale:
In the framework of the theme “Development of the IBR-2 Facility with a Complex of Cryogenic Neutron Moderators”, phased realization of the project “Construction of a complex of cryogenic moderators at the IBR-2 facility” continues. The unique complex of cryogenic moderators being constructed (using a mixture of aromatic hydrocarbons of mesitylene and metaxylene in a ratio of 3 to 1, in a solid frozen phase, in the form of beads with a diameter of 3.5-3.9 mm) makes it possible to significantly increase the cold neutron flux for experimental condensed matter research.

The complex of cryogenic moderators includes three moderators surrounding the reactor core. Cold neutrons for physics experiments are produced with the CM-202 cryogenic neutron moderator (in the direction of neutron beamlines № 7,8,10,11) and the CM-201 cryogenic moderator (in the direction of beamlines № 1,4,5,6,9). These moderators are currently operating in trial operation mode. The CM-203 neutron moderator is at the stage of development of the technical design specification. The commissioning of the CM-203 cryogenic moderator will make it possible to provide cold neutrons for neutron beamlines № 2, 3.

The operation of the complex of cryogenic moderators at the IBR-2 nuclear facility greatly increases the intensity of cold neutrons compared to the thermal moderator and can significantly shorten the time of experiments and improve the accuracy of the data obtained.

Expected results upon completion of the subproject:
1. Operation of the complex of cryogenic moderators at the IBR-2 nuclear facility, comprising three moderators CM-201, CM-202, CM-203, covering most of the neutron experimental beamlines of the IBR-2 facility. Reliable and trouble-free operation of the complex will allow maintaining and strengthening the leading position of the IBR-2 reactor among the world's most high-intensity research neutron sources used for condensed matter investigations by neutron scattering methods.

Expected results of the subproject in the current year:
1. Continuation of work on the optimization of the system of automatic control and regulation of parameters, system of charging/discharging and transportation of the moderator material (frozen mesitylene pellets) in the working chambers and pipelines of the cryogenic complex with the simultaneous use of two cryogenic moderators CM-201 and CM-202 for physics experiments.
2. In order to ensure the most efficient use of the suite of IBR-2 instruments in working with cold neutrons, it is planned to put into operation the second Linde AG cryogenic refrigerator with a cooling power of 1800 W at 10 K (KGU 1800/10). Until the end of 2023, it is planned to carry out the optimization of the operation of the cryogenic complex, develop requirements specification and project documentation for the CM-203 cryogenic moderator for beamlines 2 and 3.

FLNP, LIT, BLTP, VBLHEP, FLNR	see subproject participants	

Brief annotation and scientific rationale:

Within the framework of the project, it is planned to study the structural features, magnetic ordering, dynamics, physicochemical properties of new promising materials and nanosystems that demonstrate important functional properties, the microscopic mechanisms of which are poorly understood. The list of objects of study includes multiferroic materials, alloys with giant magnetostriction and shape memory effects, low-dimensional and geometrically frustrated magnets exhibiting unusual magnetic states and properties, materials promising for use in compact electric current sources, magnetic layered nanostructures demonstrating various proximity effects, for example, the coexistence of superconducting and magnetically ordered states, organic functional materials with hydrogen bonds, complex fluids and polymers with a wide range of potential technological applications, the structural organization and properties of which can change significantly with changes in concentration and chemical composition, biological nanosystems, including lipid membranes, proteins and their complexes, the study of which makes it possible to understand the biophysical processes occurring in living organisms, the mechanisms of action and transfer of drugs, the causes of various diseases, biohybrid materials, structural materials that are widely used or planned to be used in various industrial and manufacturing sectors. In addition, it is planned to conduct applied studies of texture, residual stresses and internal organization of rocks and minerals, structural materials, objects of natural and cultural heritage, aimed at establishing mechanisms of geophysical processes, formation of defects and stressed areas in industrial products, reconstruction and analysis of ancient technologies, evolution and development of classification of fossil organisms.

Expected results upon completion of the project:

1. The realization of the scientific program of the project is expected to result in obtaining new experimental information, which will be of great importance for establishing the relationship between the structural features and dynamics of new functional materials and nanosystems and their physical properties at the microscopic level, as well as for developing modern concepts in the field of condensed matter physics, chemistry, materials science, biophysics and geophysics. A number of the results obtained can later be used to develop scientific foundations for the development of advanced technologies in the field of electronics, compact current sources, pharmacology and medicine. During the implementation of the scientific program, theoretical predictions and models will be experimentally tested, and new phenomena and regularities will be revealed.
2. The implementation of the methodological program will result in the modernization of the available spectrometers and the development and construction of new instruments at IBR-2, which will expand the scope of their application for interdisciplinary scientific research of new functional materials and nanosystems.

Expected results of the project in the current year:

Realization of scientific program

1. Determination of the structural parameters and phase composition of intermetallic functional materials, including magnetostriction Fe-Ga alloys and shape memory alloys.
2. Determination of parameters of the atomic and magnetic structure of low-dimensional magnetic materials in a wide range of thermodynamic parameters (temperature, pressure).
3. Analysis of high-pressure effects on the structural and magnetic properties of functional materials.
4. Analysis of complex structural and microstructural states of solid electrolytes and electrodes for metal-ionic accumulators.
5. Determination of the crystal structure and analysis of the dynamics of functional materials with molecular complexes and ionic liquids.
6. Establishing of phenomena and effects, related to coexistence of magnetism and superconductivity in layered nanostructures composed of transition, rare-earth and other metals.
7. Determination of structural characteristics of carbon nanomaterials, single wall carbon nanotubes on substrates.
8. Determination of structural characteristics and aggregation kinetics in fullerene solutions with different polarity, and in fullerene solutions with various amino adducts.
9. Analysis of structural properties of magnetic nanosystems, including colloids, composites with magnetic nanoparticles, aggregation effects in magnetic fluids and core-shell nanostructures.
10. Determination of structural characteristics of polymer systems on substrates, surfactant micelles in bulk and on the surface, surfactant-micelle complexes.

11. Analysis of structural organization of polymer nanomaterials, glass transition of polymers and polymer thin films.
12. Analysis of physical and biological properties of lipid and native membranes, protein interactions, structure and properties of protein and membrane-protein complexes, crystallization of proteins.
13. Determination of structural characteristics and study of properties of biohybrid complexes.
14. Determination of residual stresses and microstrains in constructional materials and bulk products, geological objects.
15. Texture analysis of biological and paleontological objects, construction materials and earth rocks.
16. Analysis of internal organization and construction of 3D models of cultural and natural heritage objects, industrial materials and products using neutron radiography and tomography.

Realization of instrument development program for the IBR-2 spectrometers

1. Installation of elements of the neutron guide system of the small-angle scattering and imaging spectrometer on beamline 10.
2. Development of the neutron guide system for the new DN-6 diffractometer for studies of microsamples, aimed at improving its technical parameters and expanding the available range of high pressures.
3. Improvement of technical parameters and expansion of experimental capabilities of the GRAINS multifunctional reflectometer (startup of a new neutron beam chopper, development of electrochemical and liquid cells for experiments).
4. Modernization of the available IBR-2 spectrometers aimed at improving their technical characteristics, replacing obsolete and failed units.
5. Upgrade of the FSS correlation spectrometer on beamline 13 and improvement of its technical parameters. Further development of the RTOF correlation method.

Subprojects:

2.1. Study of structure and dynamics of functional materials and nanosystems at the IBR-2 spectrometer complex	**D.P. Kozlenko** *Deputies:* **M.V. Avdeev** **G.D. Bokuchava**	Realization
FLNP	A.G. Asadov, E.B. Askerov, M.V. Avdeev + 10 per., G.D. Bokuchava + 20 per., D.M. Chudoba + 5 per., K.M. Gasanov, S.E. Kichanov + 20 per., A.I. Kuklin + 12 per., A.N. Nabiev, V.A. Turchenko + 6 per.	
LIT	A.G. Soloviev, E.V. Zemlyanaya	
BLTP	V.Yu. Yushankhai	
VBLHEP	S.I. Tyutyunnikov	
FLNR	P.Yu. Apel, V.A. Skuratov	

Brief annotation and scientific rationale:

The subproject is aimed at studying the features of the structure, magnetic ordering, dynamics, physical and chemical properties of novel promising functional and structural materials, complex liquids and polymers, nanosystems, geophysical objects. The explanation of microscopic mechanisms of the formation of their properties is important both for the development of modern concepts in the field of condensed matter physics, materials science, biophysics, chemistry, geophysics, pharmacology, engineering sciences, and new technological applications in energy production, electronics, biology and medicine.

Neutron methods for studying matter (diffraction, small-angle scattering, reflectometry, inelastic scattering, radiography and tomography) provide detailed information about the atomic and magnetic structure and dynamics of materials at the atomic and nanoscale levels. Due to the peculiarities of the interaction of slow neutrons with matter, neutron scattering methods are highly effective in determining the positions of light atoms surrounded by heavy ones, studying the distribution of elements with close atomic numbers, studying isotopic substitution processes and magnetic structures. This provides great advantages when using neutron scattering methods in the study of a wide range of promising functional materials and nanosystems compared to other approaches.

To ensure the solution of the scientific tasks of the project, it is planned to carry out work to ensure the uninterrupted operation, modernization and reconstruction of the existing spectrometers of the IBR-2 reactor, as well as to complete the work on the

creation of a new small-angle scattering and imaging spectrometer. Along with neutron methods, complementary methods of X-ray scattering, Raman, atomic force spectroscopy, etc. with the application of additional laboratory equipment, will be used to improve the efficiency of solving the tasks.

Expected results upon completion of the subproject:

1. The realization of the scientific program is expected to result in obtaining new experimental information, which will be of importance for studying the relationship between the structural features and dynamics of new functional materials and nanosystems and their physical properties at the microscopic level, as well as for developing modern concepts in the field of condensed matter physics, chemistry, materials science, biophysics and geophysics. The obtained results can later be used to develop scientific foundations for the development of advanced technologies in the field of electronics, compact current sources, pharmacology and medicine. During the implementation of the scientific program, theoretical predictions and models will be experimentally tested, and new phenomena and regularities will be revealed.
2. The implementation of the methodological program will result in the modernization of the available spectrometers and the development and construction of new instruments at IBR-2, which will expand the scope of their application for interdisciplinary scientific research of new functional materials and nanosystems.

2.2. Development of an inelastic neutron scattering spectrometer in inverse geometry BJN (Bajorek-Janik-Natkaniec) at the IBR 2 reactor

D.M. Chudoba

Realization

FLNP

E.A. Goremychkin, A.A. Kruglov

Brief annotation and scientific rationale:

An analysis of the state of research in the field of condensed matter dynamics using inelastic neutron scattering (INS) at FLNP has shown that the existing NERA inelastic neutron scattering spectrometer, which some time ago successfully competed with similar facilities in European neutron centers, is now significantly outdated and no longer meets the needs of the user community in the Eastern European region. Therefore, an extremely important task is to upgrade the INS spectrometer in the historically established research area in order to maintain the competitive position of the FLNP JINR in the field of neutron spectroscopy among other world neutron centers.

A promising approach is the creation of a new high-luminosity INS spectrometer that will use modern neutron optics and new design solutions to obtain high-resolution results with a good signal-to-background ratio over a wide range of energy transfer and using the smallest possible mass of the sample under study. This approach is proposed to be used to develop and construct a universal inverse geometry INS spectrometer BJN (**B**ajorek-**J**anik-**N**atkaniec). The combination of the high flux of the IBR-2 pulsed neutron source, modern focusing neutron optics, energy analyzers with a very large surface (two analyzers with an area of ~3.3 m^2) will ensure the maximum possible luminosity of the spectrometer being developed, while the gain factor compared to the NERA spectrometer can be up to a factor of 400.

The main range of scientific problems for which the BJN spectrometer will be used, includes:
– investigations of structural phase transitions at the microscopic level;
– study of proton diffusion processes in systems with different types of hydrogen bonds;

– study of the dynamics of protons in molecular crystals in a wide energy-transfer range;

– investigations of associative interactions of chemical particles, including systems with the formation of hydrogen bonds of various types;

– investigations of magnetic dynamics in compounds with 4*f* and 3*d* transition metals.

List of research objects:
– molecular crystals and their phase derivatives;
– pharmaceutical preparations in the bulk form and in the form of “micronized” or “amorphous” powders;

– new biologically active compounds, including nanostructured ones;

– energy storage materials;

– intermetallic compounds of 4*f* and 3*d* transition metals;

– catalysts;

– photonic materials for industrial applications;

– nanocomposite materials.

Expected results upon completion of the subproject:
1. Development and construction of basic elements of the BJN spectrometer.

Expected results of the subproject in the current year:
1. Development of technical documentation for the creation of a number of spectrometer elements.
2. Purchase of pyrolytic graphite crystals to develop a focusing analyzer.

Project:

3. Scientific and methodological research and developments for condensed matter investigations with IBR-2 neutron beams

V.I. Bodnarchuk
V.I. Prikhodko

Realization

FLNP

see subprojects participants

Brief annotation and scientific rationale:

The conduction of condensed matter investigations at a state-of-the-art level is characterized by continuous improvement of experimental techniques, increase in the number of controlled parameters as well as in the number of detectors and sample environment systems used in the experiment and their sophistication, heightened requirements for accuracy and operation speed of data acquisition equipment, necessity to provide remote control over spectrometer subsystems and the experiment as a whole, and requires constant development of both the spectrometers and IBR-2 research nuclear facility, including in particular, the complex of cold moderators. The user policy carried out at the IBR-2 spectrometers imposes additional requirements for the equipment of the spectrometers, control systems, and data acquisition systems, which should be easy to master and easy to use, should have convenient graphic interface and provide access to measurement results via the Internet, etc.

Expected results upon completion of the project:

1. Commissioning of BSD-A detector at HRFD on beamline 5 of the IBR-2 reactor and obtaining the first experimental results.
2. Development of a vector magnet based on asymmetric Helmholtz coils, with a temperature control device for low (1.5 K) and ultra-low (down to 0.5 K) temperatures for the REMUR reflectometer.
3. Development of technical documentation for the equipment of control systems of the complex of cryogenic moderators of the IBR-2 reactor; commissioning of control systems for the collector unit and cooling pipelines, and cryogenic moderators CM-201, CM-202 and CM-203; installation of a dispatching system with a server that integrates control over the entire complex of cryogenic moderators, commissioning of the dispatching system.
4. Introduction of PLC-based control systems.
5. Installation of a new chopper on beamline 8 of the IBR-2 reactor.
6. Introduction of automatic PLC-based control systems to control the vacuum integrity in the channels.
7. Development and manufacture of PSC with a cathode of different diameters.
8. Development of a test stand to test the characteristics of PSD.
9. Optimization of data acquisition system based on multichannel digitizers.
10. Development of a standard module of a PSD system based on resistive-wire tubes with a cathode diameter of 6 mm.
11. Development and commissioning of a new detector system for the REMUR spectrometer.
12. Modernization of direct beam detectors at the YuMO spectrometer.
13. Development and fabrication of direct-beam monitor at the YuMO spectrometer.
14. Development of the architecture of a multi-gap ^{10}B-PPRC, manufacture of the prototype and study of its characteristics.
15. Development of a multi-counter system for the inelastic scattering instrument being designed on beamline 2 of IBR-2.
16. Adjustment and testing of the ASTRA-M detector at the FSD spectrometer.
17. Development of a technical design for the BSD-FSD backscattering detector for the FSD spectrometer. Adaptation of scintillation detector manufacturing technologies (existing in the SC Department) for the BSD-FSD detector. Development of mechanical components of the detector, detector electronics and data acquisition and accumulation electronics for BSD-FSD.

18. Development and manufacture of a new ±90°-detector with combined electronic and time focusing, similar to the ASTRA-M detector on the FSD spectrometer.
19. Development of detector electronics and data acquisition, pre-processing and accumulation systems for new detector systems. Introduction of CAEN digitizers into the measuring systems of IBR-2 spectrometers.
20. Introduction of PLCs into control systems of spectrometers. Equipping spectrometers with video surveillance systems. Introduction of new measuring devices and controllers at the request of instrument responsibles. Automation of the vacuum control system on spectrometers NERA, SKAT, FSD, FSS. Automation of the control system of the magnet current source for the DN-12 cryostat. Unification of temperature control and regulation systems used on IBR-2 spectrometers.
21. Development of a new cryostat for cooling high-pressure chambers at the DN-12 diffractometer.
22. Development and implementation on the IBR-2 spectrometers of a new version of the Sonix+ sotware package and related systems adapted to work with the event list data format.
23. Continuous modernization (in cooperation with LIT) of the FLNP local area network segment.
24. Simulation of spectrometers or its elements for the purpose of modernization of operating spectrometers and for the development of the new one.
25. Commissioning of an automated storage of containers with irradiated samples and an automated sample positioning system at the irradiation facility.
26. Providing of uninterrupted operation of all spectrometers on IBR-2 beamlines.

Expected results of the project in the current year:

1. Manufacture of spare units for the MPD32-USB3 data acquisition and accumulation system.
2. Adjustment of CAEN amplifier modules in accordance with the required parameters.
3. Manufacture of a set (432 pcs.) of I/O and measuring cables.
4. Dismantling of the BSD detector and installation of the BSD-A detector at the HRFD diffractometer on beamline 5 of the IBR-2 reactor.
5. Development of technical design of the magnet.
6. Fabrication of the cryostat stand.
7. Development and testing of the control system of the cryogenic moderator CM-201 in the direction of beamlines 1, 4, 5, 6, 9.
8. Development of a technical design of a new chopper for beamline 8 of the IBR-2 reactor.
9. Installation and commissioning of ASTRA-M detector at the FSD spectrometer. Development of a detector module and DAQ system for the multidetector system of the DN-12 spectrometer, tests of DAQ elements at neutron beamlines of the IBR-2 reactor. Development of the prototype of the detector module with analogue electronics for the NERA spectrometer. Development of infrastructure for the development of neutron detectors.
10. Development of a technical design of a flow cryostat with He-4 circulation with cooling by a closed cycle cryocooler to achieve a temperature range below 2K. Selection and purchase of equipment and accessories. Fabrication of new windings and assembling of the SC magnet for the DN-12 spectrometer.
11. Simulation of SANS instrument for the future neutron source in FLNP.
12. Introduction of CAEN digitizers into the measuring systems of IBR-2 spectrometers (FSD, FSS, HRFD).
13. Support and development of the SONIX+ software on requests of responsibles, based on USB-3 adaptation of SONIX+ software for the operation with DAQ controllers. Development of the new version of SONIX+ software adjusted for the operation i list mode.
14. Improvement of the concept of the central data repository, taking into account the experience gained in its operation and practical testing of possible ways of its implementation.
15. Study of radiation resistance of different materials at irradiation facility.
16. Incorporation of new measuring devices and controllers at the request of instrument responsibles.

Subprojects:

3.1. Construction of a wide-aperture backscattering detector (BSD-A) for the HRFD diffractometer — **V.M. Milkov** — Realization

FLNP — A.M. Balagurov, A.K. Kurilkin

Brief annotation and scientific rationale:
At present, the HRFD detector system consists of three detectors, two of which are located at scattering angles of ±152°, and the third one at 90°. The first two detectors are mainly used to study the structure of polycrystals, and the third one is employed to measure internal stresses. The detecting element is Li-glass-based scintillators. From the present-day viewpoint, these detectors have two disadvantages: high sensitivity to γ-background and insufficiently large solid angle (~0.16 sr). Due to this, the resulting diffraction spectra have a rather high background and a low (by modern criteria) data acquisition rate, despite the fact that the neutron flux at the sample position is sufficiently high (10^7n/cm^2/s).

To eliminate these shortcomings, in 2017 it was proposed to replace the existing backscattering detectors shown in Fig. 1 with a new wide-aperture scintillation detector based on the ZnS(Ag)/^{6}LiF scintillator using combined electronic-geometric focusing. Its implementation will make it possible to radically improve the parameters of the HRFD diffractometer and bring it to the leading positions in the world. Estimates show that the use of the new wide-aperture detector will allow an approximately two- to three-fold increase in the number of experiments, along with a significant improvement in the accuracy of the obtained structural information, and the expansion of the capabilities of the diffractometer for performing experiments under various external conditions at the sample position.

Expected results upon completion of the subproject:
1. Commissioning of BSD-A detector at HRFD on beamline 5 of the IBR-2 reactor and obtaining the first experimental results.

Expected results of the subproject in the current year:
1. Manufacture of spare units for the MPD32-USB3 data acquisition and accumulation system.
2. Adjustment of CAEN amplifier modules in accordance with the required parameters.
3. Manufacture of a set (432 pcs.) of I/O and measuring cables.
4. Dismantling of the BSD detector and installation of the BSD-A detector at the HRFD diffractometer on beamline 5 of the IBR-2 reactor.

3.2. Vector magnet for investigations with polarized neutrons

A.N. Chernikov

Realization

FLNP

V.I. Bodnarchuk, V.D. Zhaketov

Brief annotation and scientific rationale:
Reflectometry of polarized neutrons is an experimental method for studying low-dimensional metal heterostructures, polymer films, biological systems, the free surface of liquids, magnetic fluids, and requires experimental equipment that includes a special magnetic system. The developed magnetic system—a vector magnet—will allow changing the direction of the magnetic field in two directions and will have an aperture that allows placing a temperature control device at low and ultra-low temperatures, as well as a neutron and gamma-ray detection system. The vector magnet will be installed on the REMUR reflectometer on beamline 8 of the IBR-2 reactor.

Expected results upon completion of the subproject:
1. Development of a vector magnet based on asymmetric Helmholtz coils, with a temperature control device for low (1.5 K) and ultra-low (down to 0.5 K) temperatures for the REMUR reflectometer.

Expected results of the subproject in the current year:
1. Development of technical design of the magnet.
2. Fabrication of the cryostat stand.

3.3. Design and development of infrastructure elements for spectrometers at the IBR-2 reactor

V.I. Bodnarchuk

Realization

FLNP

A.N. Chernikov, A.S. Kirilov, V.M. Milkov, V.I. Prikhodko, V.V. Sadilov, V.V. Zhuravlev

Brief annotation and scientific rationale:
The IBR-2 reactor is a unique neutron source, which is used to study the structure and physical properties of condensed matter. Information about objects under study is obtained using specialized neutron scattering instruments (spectrometers) by applying various research techniques. The quality of the obtained information is largely determined by the characteristics of the neutron source and the quality of experimental equipment. The IBR-2 pulsed reactor is a high-flux neutron source with a power of over 1 MW. The key requirements for the equipment of scientific instruments are the most efficient use of the thermal neutron flux within the framework of the implemented methodology. The equipment of any spectrometer is quite diverse and includes elements that form a neutron beam, systems for detecting neutron and other types of radiation, various systems for monitoring and controlling experiments, special equipment for creating the required conditions at the sample position during measurements, etc.

At the same time, all elements and mechanisms must perform their functions under conditions of increased radiation load and ensure uninterrupted operation for long periods of time. Each spectrometer is a unique object even within the framework of the implementation of one and the same technique at the same source. Despite the fact that the equipment of IBR-2 instruments includes a number of standard elements, their configuration is always unique and requires special attention.

This sub-subproject is aimed at fulfilling the tasks of designing and developing reliable and efficient elements of spectrometers for comprehensive support of experimental work and obtaining high-level scientific results.

The high qualification of the personnel of the Department of the IBR-2 spectrometers' complex (SC) and their extensive experience in the development and operation of equipment and control systems for the IBR-2 spectrometers will undoubtedly make it possible to implement this sub-subproject aimed at further improving the experimental infrastructure of the IBR-2 reactor. The sub-subproject consists of 7 sections, each representing a separate element of the experimental infrastructure.

Expected results upon completion of the subproject:

1. Development of technical documentation for the equipment of control systems of the complex of cryogenic moderators of the IBR-2 reactor; commissioning of control systems for the collector unit and cooling pipelines, and cryogenic moderators CM-201, CM-202 and CM-203; installation of a dispatching system with a server that integrates control over the entire complex of cryogenic moderators, commissioning of the dispatching system.
2. Introduction of PLC-based control systems.
3. Installation of a new chopper on beamline 8 of the IBR-2 reactor.
4. Introduction of automatic PLC-based control systems to control the vacuum integrity in the channels.
5. Development and manufacture of PSC with a cathode of different diameters.
6. Development of a test stand to test the characteristics of PSD.
7. Optimization of data acquisition system based on multichannel digitizers.
8. Development of a standard module of a PSD system based on counters with resistive anodes and a cathode diameter of 6 mm.
9. Development and putting into operation of a new detector system for the REMUR spectrometer.
10. Modernization of direct beam detectors at the YuMO spectrometer.
11. Development and fabrication of direct-beam monitor at the YuMO spectrometer.
12. Development of the architecture of a multi-gap ^{10}B-PPRC, manufacture of the prototype and study of its characteristics.
13. Development of a multi-counter system for the inelastic scattering instrument being designed on beamline 2 of IBR-2.
14. Adjustment and testing of the ASTRA-M detector at the FSD spectrometer.
15. Development of a technical design for the BSD-FSD backscattering detector for the FSD spectrometer. Adaptation of scintillation detector manufacturing technologies (existing in the SC Department) for the BSD-FSD detector. Development of mechanical components of the detector, detector electronics and data acquisition and accumulation electronics for BSD-FSD.
16. Development and manufacture of a new ±90°-detector with combined electronic and time focusing, similar to the ASTRA-M detector on the FSD spectrometer.
17. Development of detector electronics and data acquisition, pre-processing and accumulation systems for new detector systems. Introduction of CAEN digitizers into the measuring systems of IBR-2 spectrometers.
18. Introduction of PLCs into control systems of spectrometers. Equipping spectrometers with video surveillance systems. Introduction of new measuring devices and controllers at the request of instrument responsibles. Automation of the vacuum control system on spectrometers NERA, SKAT, FSD, FSS. Automation of the control system of the magnet current source for the DN-12 cryostat. Unification of temperature control and regulation systems used on IBR-2 spectrometers.
19. Development of a new cryostat for cooling high-pressure chambers at the DN-12 diffractometer.
20. Development and implementation on the IBR-2 spectrometers of a new version of the Sonix+ sotware package and related systems adapted to work with the event list data format.
21. Continuous modernization (in cooperation with LIT) of the FLNP local area network segment.
22. Simulation of spectrometers or its elements for the purpose of modernization of operating spectrometers and for the development of the new one.

23. Commissioning of an automated storage of containers with irradiated samples and an automated sample positioning system at the irradiation facility.
24. Providing of uninterrupted operation of all spectrometers on IBR-2 beamlines.

Expected results of the subproject in the current year:

1. Development and testing of the control system of the cryogenic moderator CM-201 in the direction of beamlines 1, 4, 5, 6, 9.
2. Development of a technical design of a new chopper for beamline 8 of the IBR-2 reactor.
3. Installation and commissioning of ASTRA-M detector at the FSD spectrometer. Development of a detector module and DAQ system for the multidetector system of the DN-12 spectrometer, tests of DAQ elements at neutron beamlines of the IBR-2 reactor. Development of the prototype of the detector module with analogue electronics for the NERA spectrometer. Development of infrastructure for the development of neutron detectors.
4. Development of a technical design of a flow cryostat with He-4 circulation with cooling by a closed cycle cryocooler to achieve a temperature range below 2K. Selection and purchase of equipment and accessories. Fabrication of new windings and assembling of the SC magnet for the DN-12 spectrometer.
5. Simulation of SANS instrument for the future neutron source in FLNP.
6. Introduction of CAEN digitizers into the measuring systems of IBR-2 spectrometers (FSD, FSS, HRFD).
7. Support and development of the SONIX+ software on requests of responsibles, based on USB-3 adaptation of SONIX+ software for the operation with DAQ controllers. Development of the new version of SONIX+ software adjusted for the operation i list mode.
8. Improvement of the concept of the central data repository, taking into account the experience gained in its operation and practical testing of possible ways of its implementation.
9. Study of radiation resistance of different materials at the radiation research facility.
10. Putting into operation of new measuring devices and controllers at the request of instrument-responsible scientists.

Project:

4. New advanced neutron source at JINR	**E.V. Lychagin** **V.N. Shvetsov** **M.V. Bulavin**	Realization
FLNP	see subproject participants	

Brief annotation and scientific rationale:

In 2020/23, within the framework of the closing theme “Development of the conceptual design of a new advanced neutron source at JINR”, important results were obtained, which are of key significance for the successful continuation of work on the development of a new high-flux neutron source at JINR. Based on the results of joint research work of JINR and JSC NIKIET (Rosatom State Corporation), which consisted in analyzing variants of a high-flux pulsed neutron source, the concept of the NEPTUN pulsed fast reactor with neptunium-nitride fuel was chosen for further elaboration. The development of the concept of the new NEPTUN reactor was included in the JINR Seven-Year Development Plan for 2017–2023.

The main stages of the development of the concept of the new NEPTUN reactor include: development of a preliminary scientific program and determination of the composition of a suite of scientific instruments for conducting neutron research, development of technical specifications for preliminary design and infrastructure projects, scientific and technical rationale for the design of the new neutron source, as well as the implementation of the research and development program, which includes the study of the dynamics of pulsed reactors, optimization of the design of the main reactor systems, development of neptunium-nitride fuel and neptunium-nitride-based fuel rods, optimization of the configuration of the moderator complex, development of prototypes or special test stands (for example, an experimental test stand or a prototype of a reactivity modulator, a prototype of experimental fuel elements, test stand for a mesitylene-based cryogenic moderator with a system for continuous reloading of the working material, etc.).

The work performed is a serious R&D groundwork laid down in the period from 2020 to 2023, requiring the continuation and development of the above stages to move from the concept stage to the stage of the draft design of the new NEPTUN reactor.

Expected results upon completion of the project:

1. Development of the scientific program and the concept of the suite of instruments for conducting research in condensed matter physics, nuclear physics and applied research at the new NEPTUN pulsed reactor.
2. Building a model of the dynamics of pulsed fast reactors.
3. Development of neptunium nitride fuel and neptunium-nitride-based fuel rods.
4. Optimization of the vessel and reactivity modulator of the NEPTUN reactor.
5. Conducting neutron-physics calculations to select optimal materials for use as a cryogenic moderator at the new NEPTUN reactor.

Expected results of the project in the current year:

1. Preparation of materials for the development of the scientific program and the concept of a suite of scientific instruments of the NEPTUN reactor.
2. Preparation for conducting experiments in accordance with the program of work under the agreement between JINR and RFNC-VNIITF on the development and verification of a mathematical model of the dynamics of the NEPTUN pulsed reactor.
3. Obtaining the first batch of neptunium oxide for testing the technology of manufacturing fuel for experimental fuel rods and conducting pre-reactor studies of fuel compositions under the agreement on the development of neptunium-nitride fuel and neptunium-nitride-based fuel rods between JINR and JSC VNIINM.
4. Preparation of materials for the technical specification for the draft design based on the results of optimization of the reactor vessel and the reactivity modulator.
5. Analysis of the efficiency of using hydrogen-containing materials (methane, triphenylmethane, liquid hydrogen, deuterium, etc.) as a cryogenic moderator at the new NEPTUN reactor (IBR-3) and their comparison with mesitylene. Development of working design documentation for a chamber-simulator of a cryogenic mesitylene-based moderator with a system for fast loading and unloading of working material.

Subproject:

4.1.	**Research and development for the justification of the draft design of the new advanced neutron source at JINR — NEPTUN pulsed fast reactor**	**E.V. Lychagin V.N. Shvetsov M.V. Bulavin**	Realization

Goremychkin, D.S. Grozdov, A.A. Khassan, K. Khramko, S.E. Kichanov, Yu.N. Kopach, D.P. Kozlenko, N. Kučerka, A.I. Kuklin, I.V. Kushnir, E.E. Perepelkin, M.M. Podlesnyy, M.V. Rzyanin, E.P. Shabalin, A.E. Verkhoglyadov, I. Zinicovscaia, + 3 engineers, 3 researchers	
	VNIITF	S.A. Andreev, D.V. Khmelnickii, + 3 researchers	
	VNIINM	A.V. Davydov, Yu.A. Ivanov, + 7 engineers, + 4 researchers	
	NIKIET	A.B. Goryachikh, A.V. Lopatkin, I.T. Tretyakov, + 4 engineers, + 3 researchers	

Brief annotation and scientific rationale:
In accordance with the roadmap of the NEPTUN project, the next major stage after the completion of the stages of preliminary design and development of a technical proposal is a draft design. A draft design is developed to determine the principal (constructive, schematic, etc.) solutions for the product, giving a general idea of the working principle and (or) the design of the product. On the basis of the draft design, a justification for investments is developed, which is an obligatory document in the development of such a complex facility as a research reactor (Decree of the Government of the Russian Federation N306 of 14.03.1997).

At the draft design stage, the development and selection of basic technical solutions, the study of structural and functional schemes of the product, the selection of basic structural elements, etc. are carried out. As a rule, at this stage, one or two variants of the reactor are considered from among those recognized as feasible at the conceptual design stage.

The choice of a specific core configuration option is the most important moment and the key point of the entire project of construction of the NEPTUN reactor. This is due to the fact that the technical solutions fixed in the draft design, further at the next stages (technical design, working design documentation), being included in the voluminous design documentation, can only be changed with great difficulty. Therefore, already before the draft design stage, a thorough study of all controversial and ambiguous points is required, as well as R&D and calculations (kinematic, electrical, thermal, etc.) that confirm the operability and reliability of the product in all specified operating conditions.

The main goal of the subproject is to conduct research and development work to justify the development of a draft design of the NEPTUN reactor. These R&D include: development of neptunium nitride fuel and neptunium-nitride-based fuel rods; study of dynamics of the pulsed reactor; optimization of the design of the reactivity modulator and the reactor vessel in terms of reducing thermal loads and shape changing; development and implementation of a list of R&D to justify the development of the draft design.

Expected results upon completion of the subproject:
1. The scientific program and the concept of the suite of instruments for conducting research in condensed matter physics, nuclear physics and applied research at the new NEPTUN pulsed reactor.
2. A working variant of the dynamic bending model and evaluation of the effect of the pellet-type structure of fuel elements (compared to the pin-type structure) on the reactivity of dynamic bending at the beginning of the fuel lifetime and verification of calculations at RFNC-VNIITF. Technical specification for conducting experiments to check the shape of the bending of a fuel element prototype under rapid heating in the neutron flux of pulsed reactors. Setting up an experiment on pulsed neutron sources of RFNC-VNIITF.
3. Obtaining a permit for the use of nuclear materials that are exclusively in federal ownership (NM EFO). Production of the first batch of neptunium oxide for the refinement of the fuel manufacturing technology for experimental fuel rods and conducting pre-reactor studies of fuel compositions. Development and manufacture of a trial batch of experimental fuel rods based on neptunium nitride.
4. Development of two variants of the reactor vessel design with the lowest thermal load and temperature deformations for the rod-by-rod core configuration and the configuration of the core with jacket fuel assemblies. Development of two variants (with and without a jacket) of the design of the reactivity modulator, operable in all specified conditions. Possibility of developing a technically justified alternative design of the modulator and reactor vessel. A list of R&D activities necessary to substantiate the design of the reactivity modulator, its components and the reactor vessel. Working design documentation for a full-scale stand (prototype) of the reactivity modulator. Start of manufacture of some elements of the stand (prototype) of the reactivity modulator according to the developed working design documentation. Technical specifications for the development of draft design and infrastructure (conceptual) projects.
5. Conducting neutron-physical calculations to select optimal materials for use as a cryogenic moderator at the new NEPTUN reactor. Development of working design documentation for a full-scale test stand of a mesitylene-based cryogenic moderator with a system for fast loading and unloading of working material.

Expected results of the subproject in the current year:
1. Obtaining the first batch of neptunium oxide for testing the technology of manufacturing fuel for experimental fuel rods and conducting pre-reactor studies of fuel compositions under the agreement on the development of neptunium-nitride fuel and neptunium-nitride-based fuel rods between JINR and SC “VNIINM”.
2. Preparation for conducting experiments in accordance with the program of work under the agreement between JINR and RFNC-VNIITF on the development and verification of a mathematical model of the dynamics of the NEPTUN pulsed reactor. Preparation for conducting experiments on vibroacoustic, thermomechanical, hydrodynamic measurements of the parameters of the model of the dynamics of the NEPTUN reactor on the basis of the JINR experimental facilities.
3. Report of SC “NIKIET” on the results of R&D on optimization of the reactivity modulator and the NEPTUN reactor vessel. Development of working design documentation for a test stand (prototype) of the reactivity modulator.
4. Analysis of the efficiency of using hydrogen-containing materials (methane, triphenylmethane, liquid hydrogen, deuterium, etc.) as a cryogenic moderator at the new NEPTUN reactor (IBR-3) and their comparison with mesitylene. Development of

working design documentation for a chamber-simulator of a cryogenic mesitylene-based moderator with a system for fast loading and unloading of working material.

5. Preliminary scientific program and the concept of a suite of scientific instruments for conducting research in condensed matter physics, nuclear physics and applied research at the new NEPTUN pulsed reactor (IBR-3).

Theoretical Physics (01)

01-3-1135-2019

Fundamental Interactions of Fields and Particles

Theme leaders: D.I. Kazakov
O.V. Teryaev

Participating Countries and International organizations:

Belarus, Bulgaria, Canada, Chile, China, Croatia, Finland, France, Germany, Greece, Hungary, India, Iran, Italy, Poland, Portugal, Russia, Serbia, Slovakia, Spain, United Kingdom, USA, Vietnam.

The problem under study and the main purpose of the research:
The main current problems of the modern theory of fundamental interactions are the development of methods of quantum field theory, their application to the description of elementary particle physics within the Standard Model and beyond, theoretical support for existing and planned experiments. Within the framework of the Standard Model, efforts will be focused on the development of multiloop computing methods and their applications to processes at the Large Hadron Collider, the development of new approaches to hadron physics, including heavy quark physics. In physics beyond the Standard Model, the search for Dark matter, manifestations of supersymmetry and other possible new physical phenomena are of particular interest. Theoretical support for the search for new physics in accelerator experiments will be combined with research and analysis of astrophysical data. Developments in neutrino physics, including the field-theoretic description of neutrino oscillations and the processes of neutrino-nucleon interactions with nuclear matter, in particular in connection with the Baikal-GVD experiment, will remain under constant concern. Special attention will be paid to the theoretical support of the key elements of the JINR experimental program. By studying QCD methods, various approaches to the description of the structure of hadrons and quark-gluon matter under the specific conditions of the NICA complex will be developed and applied.

Brief annotation and scientific rationale:
Quantum Field Theory (QFT) is a widely recognized "language" used to describe the properties of elementary particles and their interactions. It is well known that the triumph of the Standard Model (SM) of particle physics would have been impossible without comparing experimental data obtained from accelerators such as LEP (CERN), HERA (DESY), Tevatron (Fermilab), and LHC (CERN) with high-precision calculations performed using QFT methods. Many years have passed since the construction of the SM, and all these years scientists were searching for New Physics. The problem of dark matter in the Universe is an obvious argument for such searches. The main aim of the Project is to develop the quantum field formalism of gauge and supersymmetric theories, as well as to construct and study particle physics models beyond the Standard Model. In the context of the Project, it is planned to use existing experience and new ideas to investigate a wide range of problems related to high-precision calculations within and beyond perturbation theory as well as to the nature of possible New Physics. Special attention will also be paid to issues that arise at the intersection of particle physics, astrophysics, and cosmology.

Expected results upon completion of the project:
Improved estimate of the contribution from hadronic vacuum polarization to the anomalous magnetic moment of the muon.

Investigation of the shapes of higher twist contributions in deep inelastic scattering with the resummation of large threshold logarithms.

Calculation of two-loop diagrams that arise in non-relativistic QED using the effective mass method and investigation of the completeness of basis functions for elliptic polylogarithms.

Development of a new specialized computer package for the epsilon expansion of generalized hypergeometric functions with one or more variables, whose indices depend on the dimensional regularization parameter, as well as for the numerical calculation of the resulting functions.

Explicit analytical calculation of multi-point master integrals using differential equations.

Calculation of two-loop contributions to electron-muon scattering and quarkonia production.

Calculation of the double spectral density in the problem of sum rules for B-anti-B mixing, which is an important experimental quantity that imposes strict constraints on possible new physics.

Calculation of three-loop massive form factors and polarization operators in QCD.

Calculation of multi-loop amplitudes and form factors with a large number of kinematic invariants in theories with extended supersymmetry.

Derivation of systematic solutions to quantum spectral curve equations in the case of maximally supersymmetric Yang-Mills theory in four dimensions and ABJM theory in three dimensions, both in the weak and strong coupling limits.

Calculation of spectra, correlation functions, and amplitudes in a number of six-dimensional "fishnet" models.

Application of the large charge expansion method to gauge theories and analysis of the resulting implications in both particle physics and condensed matter theory.

Investigation of the scheme dependence of a previously proposed self-consistent subtraction procedure for non-renormalizable theories.

Calculation of effective potentials for a range of theories of modified gravity and their application to analyze various inflationary models.

Investigation of the theory and phenomenology of scalar and vector bosonic stars.

Detailed cosmological and astrophysical analysis of the properties of primary black holes and their connection to the dark matter problem and observable supermassive black holes.

Analysis of the prospects for experimental detection of additional Abelian gauge symmetries and an extended Higgs sector in a range of new physics models. Investigation of the so-called supersymmetric extensions of the Standard Model.

Physical analysis of LHC data aimed at detecting manifestations of the "dark sector" in events where either a Higgs boson or a Z boson is produced, accompanied by a significant fraction missing "transverse" energy (MET), presumably carried away by a messenger particle that ultimately decays into DM particles. The expected outcome is new anomalies in the experimental data (in the fortunate event – the discovery of New Physics), or, in the absence of such signals, new unique constraints on the model parameter space for the considered scenarios of dark matter and Higgs sector.

Development of new (using neural networks for global scanning) as well as optimization and improvement of existing software for modeling physical processes beyond the Standard Model.

Expected results of the project in the current year:
Development of an optimized computer package for the expansion of generalized hypergeometric functions of one or several variables, whose indices depend on a regularization parameter, in terms of either generalized polylogarithms or repeated integrals with algebraic kernels.

Development of computer code for the numerical computation of generalized hypergeometric functions and Feynman integrals defined by a system of differential equations, with any desired accuracy; for the case of functions of multiple variables, acceleration of individual procedures using modular arithmetic methods is planned to be implemented.

Comprehensive analysis of contributions to the anomalous magnetic moment of the muon resulting from the quark thresholds in the hadronic vacuum polarization.

Multi-loop analysis of the possibility of implementing the asymptotic safety scenario within a quantum field theory model with gauge, Yukawa, and scalar interactions.

Analysis of connections between integrable conformal quantum field theories in different space-time dimensions, as well as their dual models.

Calculation of multi-point correlation functions in fishnet models in the large-spin limit.

Calculation of two-loop corrections to the 3-point form factor of the energy-momentum operator for N=4 super Yang-Mills theory on the Coulomb branch.

Development of a method for systematic solution of quantum spectral curve equations for N=4 SYM and ABJM theories at large values of the Lorentz spin of twist 1 and 2 operators in the weak coupling limit.

Calculation of anomalous dimensions of operators with large quantum numbers in the Standard Model using non-perturbative methods; comparison with perturbative results.

Calculation of various observables for rare decays involving leptons, assessing the possibility of detecting New Physics in these processes.

Analysis of the Higgs boson production in events with large missing energy at the LHC within the framework of two-Higgs doublet extensions of the Standard Model with an additional hidden scalar sector.

Investigation of the problem of forming massive galaxies and supermassive black holes in the centers of galaxies in the early Universe.

Analytical derivation of a relation linking the observational properties of giant voids in the universe, which appear practically empty, with the density of matter at the center of the void and the initial parameters of the primordial perturbation from which it originated.

Analysis of the bosonic-stars stability, estimation of their lifetime.

Calculation of the «slow-roll» parameters in the framework of various models of inflation, taking into account the dynamic effects associated with the use of quantum effective potentials obtained by means of the generalized renormalization group; a study of the phenomenological consequences of these quantum effects.

2. QCD and hadron structure

I.V. Anikin
S.V. Mikhailov
O.V. Teryaev

BLTP

V.V. Bytiev, S.V. Goloskokov, R.V. Khakimov, N.V. Krasnikov, Nguen Hoang Wu, A.G. Oganesian A.V., Pimikov, A.A. Pivovarov, G.Yu. Prokhorov, V.A. Saleev, A.A. Sazonov, O.V. Selyugin, D.A. Shohonov, A.Ya. Silenko, D. Strozik-Kotlorz, N.I. Volchanskiy, V.I. Zakharov, A.S. Zhevlakov

Brief annotation and scientific rationale:
Lacking a complete theoretical understanding of the color confinement, the only method of applying QCD is based on the factorization of the short-distance (perturbative) and long-distance (nonperturbative) dynamics. The conventional systematic way of dealing with the long-distance part is to parametrize it in terms of matrix elements of quark and gluonoperators between hadronic states generating GPDs, DAs, TMDs, etc. These matrix elements have to be either extracted from experiment or determined on the lattice. In many phenomenological applications they are usually modeled in terms of various nonperturbative methods or models. The main objective of the project is to develop comprehensive theoretical frameworks to study the multi-dimensional partonic content of hadrons by combining various approaches based on the factorization theorem and starting from the first principles of QCD.

For many years, theoretical and experimental studies of the nucleon structure have been restricted to a one-dimensional picture along a light-cone direction. Within this one dimensional picture, quark and gluon contents of the nucleus are described by the parton distribution functions (PDFs) which depend on the longitiudinal momentum of the parton inside the hadron.

The last decade has witnessed a tremendous effort to go beyond this one-dimensional description of the nucleon. Recent improvements in experimental facilities such as increased electron beam luminosities and polarization degrees, detector resolution and coverage, and advanced theoretical computation frameworks, such as calculating radiative and power corrections to complementary sets of observables, provide a breakthrough for investigating the multi-dimensional partonic content of the

nucleon, which is also referred to as hadron tomography. In this respect, the multi-dimensional parton distribution functions such as transverse-momentum-dependent distribution functions (TMDs) or generalized parton distribution functions (GPDs) have been the key subjects of both experimental and theoretical studies.

With the advent of new generation colliders such as the Electron Ion Collider (EIC) in the USA and the Large Hadron electron Collider (LHeC) at CERN, theoretical improvements of these distribution functions are mandatory for a precise comparison with experimental data. Motivated from this need, the main objective of the proposed project is to develop a comprehensive theoretical framework to study the multi-dimensional partonic content of the hadrons by combining various approaches starting from the first principles of QCD.

Expected results upon completion of the project:
Analytic evaluation of 3-loop 2-point Feynman master-integrals with composite external vertices for arbitrary indices of propagators.

Calculation of $\alpha^2_s(\alpha_s\beta_0)^{n-1}$ and $\alpha^3_s\beta_1(\alpha_s\beta_0)^{n-2}$ contributions in the nonsinglet ERBL evolution kernel and correlator of two vector composite quark currents in QCD.

Calculation of pion electromagnetic form factors in the framework of light-cone sum rules in the low and (or) moderate energy regime.

Revision of distribution amplitudes (leading twist) of (pseudo)scalar and (longitudinal and transverse) vector mesons within QCD sum rules taking into account new QCD corrections $O(\alpha^2_s)$ obtained by us for all of their components.

Derivation and analysis of the full differential equation system for Feynman integrals with multiple parameters of masses and impulses.

Study of tau lepton decays and processes of electron-positron annihilation into mesons including the processes with three pseudoscalar mesons in the final state.

Investigation of the inner structure and nature of the meson interaction at low energies by using the Nambu–Jona-Lasinio model.

Study of the Drell-Yan hadronic structure function within the perturbative QCD in α^2_s order of the coupling constant. Check of the Lam-Tung identity in α^2_s order of the strong coupling constant.

Study of dark axion portal and obtaining bounds for the model in fixed target experiments. The analysis of new physics for NA64 experiment. Study of visible mode of axion or dark photon.

Study of the sum rules for hadron fragmentation functions in QCD with the use of the generalized truncated Mellin moments approach.

Investigation of analytical and numerical optimizations of perturbative series for observables using the renormalization group in QCD.

Study of anomalous transport phenomena in a relativistic quantum medium associated with the curvature of space-time.

Study of the influence of the hadron potential at large distances on the total cross sections, which determines the peculiarity of the scattering amplitude at small momentum transfer. Investigation of the energy dependence and crossing properties of the new anomalous terms of the elastic amplitude of proton-proton and proton-antiproton scattering at NICA energies.

Study of the new-found types of transverse momentum dependent parton distributions within the original frame that involves the newly-found additional contribution in the inverse Radon transforms.

Study of the phase diagram of the SU(2)-Higgs Electroweak theory. Study of Z(N) symmetry and thermodynamic properties of meta-stable states at very high temperature in the context of QCD and Electroweak theory.

The creation of a computational framework to analyze CMS Open Data.

Expected results of the project in the current year:
Calculation of four-particle decays of the tau lepton into meson states in the framework of the Nambu–Jona-Lasinio model in order to verify the model on new classes of processes.

Research of the meson interactions at low energies by using phenomenological models for better understanding of the nonperturbative region of QCD.

Study of integral representation of hypergeometric function of Horn type.

Study of heavy meson leptoproduction in Generalized Parton Distributions approach.

Study of the charge sum rules for hadron fragmentation functions in QCD.

Study of inclusive hadron production in proton-proton and heavy-ion collisions at the collider NICA kinematics.

Analytical and numerical optimization of perturbative series for observables using the renormalization group in QCD. Applications to the DIS sum rules.

Calculation of the electromagnetic pion form factor for moderate momentum transfers in the framework of the analytical perturbation theory of QCD and comparison with the latest JLab experimental data.

Analytical and numerical optimizations of perturbation series are expected to be performed for observables using β-expansion and renormalization group in QCD. Improvement of estimates of: *R*-relation, width of tau-decay, and Bjorken polarized SR.

The main asymptotics at small Bjorken x for the QCD kernels DGLAP, P(x), and ERBL, V(x,y), at any number of loops n.

Investigation of the possibility of the existence of previously unknown phase transitions in a relativistic fluid of elementary particles in the region of ultralow temperatures and extremely high accelerations and vorticities.

Derivation of estimates for the energy dependence of the contribution of the tenzor pomeron to the spin-dependent amplitudes of nuclon-nuclon elastic scattering. Getting quantitative description of all available experimental data of the differential cross sections and spin-correllation parameters in elastic NN-scattering from sqrt(s)= 5 GeV up to sqrt(s)= 14 TeV.

The study of the contribution of effects induced by the effective one-loop action of Heisenberg-Euler QED, as well as its generalization to QCD, to the transport coefficients of transport effects (CME, CSE, CESE, CMW, CEW, CVE) in heavy ion collisions. The study of particle productions with orbital angular moments in strong interactions at heavy-ion collisions

Analysis of manifestation of dark matter axions in spin effects.

Implementation of analytic evaluations of 3-loop 2-point Feynman master-integrals with composite external vertices for arbitrary indices of propagators.

Calculation of the correlator of two vector composite quark currents and the nonsinglet Efremov- Radyushkin-Brodsky-Lepage evolution kernel of the orders $\alpha^2_s(\alpha_s\beta_0)^{n-1}$ and $\alpha^3_s\beta_1(\alpha_s\beta_0)^{n-2}$ in QCD.

Study of the T-odd hadronic structure function of Drell-Yan processes taking into account quark polarization.

3. Phenomenology of strong interactions and precision physics

BLTP

V.I. Korobov
M.A. Ivanov
D. Aznabayev, G. Gurjav, A.N. Issadykov, D.I. Melikhov, Yu.S. Surovtsev, J. Tyulemissov, A. Tyulemissova

Brief annotation and scientific rationale:
The project is expected to develop low-energy effective field theories: non-relativistic quantum electrodynamics (NRQED) and covariant quark model of hadrons (Covariant Confined Quark Model, CCQM).

The Standard Model of particle physics, formulated about 50 years ago, forms the basis of our understanding of fundamental interactions. During this time, significant theoretical work has been carried out to improve the calculation technique and increase the accuracy of predictions in the SM. An effective field theory (EFT) is a quantum field theory which is not fundamental but is valid over a limited range of energies or distances. This makes it possible to successfully use EFT and renormalization group methods to calculate real physical quantities and processes observed in the experiment with high accuracy. The EFT approach provides not only a systematic approach to the analysis of experimental results, but is also a valuable tool for determining the correlation of various observables, which gives a deeper understanding of where to look for possible indicators of new physics beyond the SM.

Expected results upon completion of the project:
Exploration of the possibilities of using the combined approach in NRQED, when part of the contributions to the energy of the bound system is considered in the framework of QED, as the total sum over all terms in the powers of the electron binding parameter $v/c \sim Z\alpha$.

Introduction of new terms in the general NRQED scheme, which will make it possible to take into account the contributions of light scattering on light, nontrivial centipede diagrams for one- and two-loop self-energy diagrams, necessary for calculating corrections of the order $m\alpha^7$-$m\alpha^8$ and higher.

It is planned to study the spectra of pionic (π^-−He+) and kaonic (K^-−He+) helium atoms in order to refine the pion and kaon masses. The expected relative accuracy in mass measurements is ~10^{-8}.

Within the framework of CCQM, investigate the possibility of violation of lepton universality in lepton decays of charmonium and bottomonium and their radial excitations.

Obtain bounds on the values of the Wilson coefficients of the Standard Model Effective Theory (SMEFT) operators responsible for the violation of lepton universality in the tauon sector.

Calculate the partial widths of strong and electromagnetic decays of vector D-mesons with an open charm.

Calculate matrix elements and widths of nonleptonic two-particle decays of charmed baryons without changing the charm.

Perform an analysis of strong decays of the charmonium-like state Y(4230) in order to study the nature of its structure.

Perform a theoretical analysis of lepton decays of the B-meson with four leptons in the final state.

Expected results of the project in the current year:
Calculation of the transition energies in the antiprotonic helium (p^-−He^+) atom, taking into account corrections in the $m\alpha^7$-$m\alpha^8$ orders, within the framework of the adiabatic approach for comparison with the results of the ASACUSA experiment at CERN. The expected relative accuracy is ~10^{-11}.

Calculation of the fine and hyperfine structure parameters in the bound states of molecular hydrogen ions H_2^+ and HD^+ taking into account all contributions up to the order of $m\alpha^7\ln(\alpha)$ inclusive, which gives a relative accuracy of the frequency (energy) of ro-vibrational transitions ~10^{-12} comparable to the accuracy of determining the Rydberg constant from 1S-2S spectroscopy of the hydrogen atom.

Investigation of the possibility of violation of lepton universality in lepton decays of charmonium and bottomonium and their radial excitations within the framework of CCQM.

Obtaining of bounds on the values of the Wilson coefficients of the Standard Model Effective Theory (SMEFT) operators responsible for the violation of lepton universality in the tauon sector.

Calculation of the partial widths of strong and electromagnetic decays of vector D-mesons with an open charm.

4. Theory of hadronic matter under extreme conditions	**V.V. Braguta** **E.E. Kolomeitsev** **S.N. Nedelko**
BLTP	T. Bhattacharyya, M. Bordag, M. Hasegawa, Y. Heo, Yu.B. Ivanov, A.S. Khvorostukhin, K.D. Montenegro, A.V. Nikolsky, A.A. Roenko, A.M. Snigirev, D.A. Sychev, A.A. Roenko, N.S. Tsegelnik, V.E. Voronin, D. Voskresensky

Brief annotation and scientific rationale:
Modern heavy ion accelerators make it possible to study the properties of strong interactions of elementary particles, which are described by quantum chromodynamics (QCD) under the influence of extreme external conditions. In particular, the quark-gluon matter that is created in such experiments is expected to have a temperature of several hundred MeV, the baryon chemical potential of about 100 MeV, external magnetic field eB ~ 1 GeV^2 and relativistic rotation with an angular velocity of ~ 10 MeV. Such conditions significantly change the properties of QCD. In the presented project, it is planned to study the properties of QCD at nonzero baryon density, high temperature, large external magnetic field and relativistic rotation using lattice simulation and other approaches.

Expected results upon completion of the project:
In the presented project, it is planned to study the properties of QCD at non-zero baryon density, non-zero temperature and non-zero magnetic field using lattice simulation with an imaginary chemical potential, dynamic u-, d-, and s- quarks and the physical mass of the pi-meson. To conduct such a study, a program written by our group will be used that implements advanced supercomputer technologies and algorithms.

It is expected that quark-gluon matter, which is produced in the process of collision of heavy ions, is not only highly heated and affected by a strong magnetic field but also has a non-zero angular velocity of rotation. Therefore, to interpret the results of heavy ion collision experiments, an important theoretical problem is the study of the properties of rotating quark-gluon matter. In the presented project, we are planning for the first time to study the properties of rotating quark-gluon matter in the framework of lattice simulation.

One of the aims of the project is to impose new constraints on the equation of state of the nuclear and hadronic matter under extreme conditions existing in heavy-ion collisions and the centers of compact stars. For this, the description of strongly interacting systems in and out of equilibrium will be developed. Such observables as the strange and charmed particle production, the directed and elliptic flows of particles, the global spin polarization of hyperons and their intercorrelations will be analyzed within transport and hydrodynamic approaches and compared with existing and future experimental data. Various sources of the spin polarization such as local vorticity of the medium, axial vortex effect, and electromagnetic field will be quantitatively compared and their role in the formation of the observable polarization signal will be clarified.

The possibility of the thermodynamic description of light nuclei and hypernuclei production in heavy-ion collisions within the hydrodynamic approach will be theoretically explored. Formulation of the equations of the viscous hydrodynamics with the internal spin and rotation degrees of freedom as an effective field theory will be achieved. Possible phase transformation in nonequilibrium and equilibrium nuclear matter under the influence of compression, heating, magnetic field, and rotation will be

classified and studied. New constraints on the equation of state from the description of the neutron star masses, radii, and the neutron star cooling should be obtained.

Elementary hadronic scattering amplitudes and the corresponding differential cross sections are important ingredients of transport models. The multichannel description of the meson-baryon scattering within the generalized potential approach based on the chiral SU(3) Lagrangian with the parameters tuned to the lattice QCD data and available experimental data on the hadron scattering will be developed.

Expected results of the project in the current year:
The equation of state calculated within the relativistic mean-field model and the particle propagation under the influence of the corresponding mean-field potentials will be included in the PHSD model. The impact of the potentials on the particle flow and the spin polarization will be investigated.

New experimental data and, particularly, the directed flow obtained by the STAR collaboration for gold-gold collisions at the center of mass energy 3GeV will be analyzed within the hydrodynamic approach.

Superfluidity and superconductivity of vector bosons in a rotating piece of nuclear matter and a strong magnetic field will be studied.

The properties of soft meson modes will be studied in equilibrium and nonequilibrium nuclear systems.

Charm meson scattering off pions will be analyzed within the effective chiral field theory. The method of calculation of triangle and box diagrams conserving power counting will be developed. The resulting amplitudes will be confronted with the Lattice QCD results.

Study of various issues related to the influence of rotation on the properties of gluodynamics and QCD. In particular, it is planned to study the equation of state of a rotating QCD, the effect of rotation on the confinement/deconfinement phase transitions and the breaking/restoration of chiral symmetry, the effect of rotation on the interaction potential of static quarks, inhomogeneous phases of rotating quark matter, etc.

Study of the simultaneous influence of the magnetic field and the baryon density on the QCD equation of state. In this case, lattice calculations will be carried out with the physical masses of dynamic u-, d-, s-quarks.

5. Theory of electroweak interactions and neutrino physics	**A.B. Arbuzov** **V.A. Naumov**
BLTP	A. Ahmedov, Yu.M. Bystritskii, M. Deka, A.D. Dolgov, M.S. Dvornikov, S.B. Gerasimov, N.L. Haong, I.D. Kakorin, S.G. Kovalenko, K.S. Kuzmin, D.A. Kuznetsov, A.A. Nikitenko, K. Nurlan, A.A. Osipov, V. Shmidt, M.K. Volkov, U.E. Voznaya, A.F. Zakharov
DLNP	D.S. Shkirmanov

Brief annotation and scientific rationale:
The Standard Model of particle physics is the most successful theory of fundamental interactions. Despite numerous experiments on its verification and a deep theoretical study of its properties, there are still many problems in this model that need to be solved. The presence of such problems leads us to believe that the Standard Model is only an effective theory, i.e., a low-energy approximation of a more fundamental physical theory. To search for new physical phenomena, it is necessary to have high-precision predictions obtained within the framework of the Standard Model. Within this project, it is planned to obtain such predictions for the conditions of existing and future experiments at colliders, including LHC, FCCee, CEPC, ILC. Calculations will be carried out in order to carry out precise verification of the Standard Model (SM) and search for the limits of applicability of the latter.

Neutrinos are a unique source of information on physics beyond the Standard Model. In particular, reliably observed transitions between different types of neutrinos (neutrino flavors) indicate a violation of the conservation of the electron, muon and taon quantum numbers, which is present in the SM with massless neutrinos. The project is devoted to the study of physical processes involving neutrinos, including elementary exclusive interactions of neutrinos with nucleons and nuclei, neutrino transport in matter, taking into account coherent and inelastic interactions, study of astrophysical and cosmological effects, superhigh-energy neutrinos in cosmic rays, manifestation of neutrino oscillations in primary nucleosynthesis under extreme astrophysical conditions (in particular, in the vicinity of astrophysical black holes), as well as in accelerator and reactor experiments. In particular, the hypothesis about the possible existence of a sterile neutrino, its role in nucleosynthesis and the formation of the large-scale structure of the Universe will be considered. It is also planned to study a new mechanism for the production of ultrahigh-energy neutrinos, up to 10^{21} eV (UHECR) in models of modified gravity in higher-dimensional space. Research carried out within the framework of this project will allow obtaining restrictions on models of compact objects, on the properties of particles (for example, on the mass of a graviton), as well as on alternative theories of gravity, which have been proposed recently. In recent years, reliable evidence has been obtained for the association of high-energy neutrinos with blazars, which are most likely

supermassive black holes, and the construction of consistent models of these phenomena is also extremely important and timely. Cosmological and astrophysical phenomena predicted in modified gravity models will be investigated. First of all, scalar-tensor models of gravity will be considered and the manifestations of quantum field effects in them will be studied.

Expected results upon completion of the project:
Improvement of basic phenomenological models of electromagnetic nucleon forms-factors in the space-like and time-like domains of q^2 based on the global statistical analysis of elastic electron scattering data on hydrogen and deuterium. Implementation of the models in the form of software modules of the GENIE neutrino generator. Application of the results to calculations of the cross sections of neutrino-nucleon interactions in the models of the running axial mass (M_A^{run}) and SuSAM*.

Improvement of the superscaling model SuSAM* with a modified scaling function based on a global statistical analysis of quasielastic electron scattering data on various nuclear targets (from hydrogen to uranium). Model implementation in the GENIE generator. Predictions of the momentum distribution of nucleons in the nucleus within the superscaling approach.

Improvement of the RK model of resonance neutrinoproduction of pions with corrected contributions to the full amplitude based on the global statistical analysis of single pion production data in (anti)neutrino interactions with hydrogen and deuterium. Implementation of the model in the GENIE generator.

Development of a method for solving the quantum kinetic equations describing the transport of massive high-energy neutrinos in heterogeneous (astrophysical) media taking into account the neutrino mixing (including mixing with hypothetical sterile states) and their coherent and inelastic interactions with matter. Application of the theory to the calculation of the passage through the Sun of neutrinos generated by cosmic rays in the solar atmosphere (prediction of the flavor composition, energy and angular distributions). Evaluation of the corresponding background in the experiments on the detection of neutrinos generated by the annihilation of dark matter particles gravitationally bound in the Sun.

Study of the contribution of ultra-high energy neutrinos arising in a multidimensional modification of gravity and comparison of theoretical expectations with observations with the Baikal GVD and IceCube detectors.

Calculation of electroweak radiative corrections to electron-positron annihilation processes, which are planned to be studied at future colliders, including FCCee, CEPC and Super Charm-Tau Factory. Creation of computer programs that can be directly used to simulate and analyze data from experiments at these colliders.

Application of the method of parton distributions developed in QCD to describe electrodynamic corrections to processes studied in current and future experiments in the field of high energy physics.

Construction of high-precision theoretical predictions for Bhabha scattering processes at small and large angles used for luminosity monitoring at electron-positron colliders.

Analysis of semileptonic many-particle decay modes of tau leptons taking into account the excited states of mesons in intermediate states. Construction of a consistent scheme for describing such decays and creation of a computer program for simulating such processes.

Expected results of the project in the current year:
Study of a new mechanism for the production of high-energy cosmic rays due to the annihilation and decay of superheavy dark matter particles in the form of heavy leptons. High-energy neutrinos arising in these processes can potentially be detected by the Baikal GVD and IceCube neutrino telescopes.

Analysis of cosmological restrictions on the sterile neutrino properties at a large mixing angle with active neutrinos, in particular, the effects of a possible resonance.

As part of the TAIGA experiment, search for joint events with ultrahigh-energy neutrinos detected with the Baikal GVD and IceCube facilities.

A two-loop implementation of the inverse seesaw mechanism with residual discrete symmetry stabilizing dark matter.

Construction of an extension of the left-right-symmetric model with a universal seesaw mechanism and additional loop suppression, so that the Yukawa coupling constants of new particles with ordinary particles can take large values, making their experimental observation potentially possible.

Development of an extension of the Standard Model with an axion-like particle contributing to the neutrino mass and dark matter.

Based on a global statistical analysis of data on electron interactions with nuclei (from deuterium to uranium), a superscaling model of the interaction of leptons with nuclei (SuSAM*) with a modified scaling function will be upgraded and enhanced. The upgraded model will be tested on modern data on quasielastic scattering of (anti)neutrinos by nuclei. It is planned to implement the model in the Monte Carlo neutrino generator GENIE.

Application of the method of parton distributions in QED to describe the processes of electron-positron annihilation, muon decay and electron-muon scattering under the conditions of current and future experiments. With its help, higher-order radiative corrections will be taken into account in the next-to-leading order logarithmic approximation.

Analysis of semileptonic many-particle decay modes of tau leptons taking into account the excited states of mesons in intermediate states. Construction of a consistent scheme for describing such decays in the framework of the Nambu-Jona-Lasinio model.

Analysis of quantum field effects in scalar-tensor models of modified gravity, including the generation of cosmological inflation due to effective potentials and the study of instabilities in solutions for the scalar field.

Description of the processes of electron-positron annihilation into D-mesons through intermediate states of excited charmonia for experiments at the BESIII accelerator and the future Super Charm-Tau Factory.

01-3-1136-2019

Theory of Nuclear Systems

Theme leaders: N.V. Antonenko
A.A. Dzhioev
S.N. Ershov

Participating Countries and International organizations:
Armenia, Belarus, Belgium, Brazil, Bulgaria, China, Czech Republic, Egypt, France, Germany, Greece, Hungary, India, Iran, Italy, Japan, Kazakhstan, Lithuania, Mexico, Norway, Poland, Republic of Korea, Romania, Russia, Serbia, Slovakia, South Africa, Spain, Sweden, Ukraine, United Kingdom, USA, Uzbekistan.

The problem under study and the main purpose of the research:
The theme proposes to research and develop ways to solve current problems in nuclear physics, relativistic nuclear physics, nuclear astrophysics, in the field of quantum few-body systems, and nonlinear quantum processes. Researches will be closely coordinated with experimental programs at facilities that exploit high-intensity beams of stable and/or radioactive ions at JINR (SHE-factory, ACCULINA-2) and worldwide (FAIR, ISOL facilities, SPES, SPIRAL2, FRIB, RAON, HIAF, iThemba LABS, ELI-NP). Studies of collisions of high-energy heavy ions and the phenomenon of color transparency will be associated with the NICA project at JINR. Large-scale studies of the structure of exotic nuclei, the dynamics of nuclear reactions, properties and methods of obtaining superheavy nuclei are planned. The task is to include dissipation and diffusion in the dynamics of the nucleus-nuclear interaction and preserve the essence of the quantum multiparticle nature of colliding nuclei. The study of systems with a small number of particles is also necessary in order to describe resonant processes in nuclear physics and high-energy physics. Studies of nonlinear quantum processes in very strong polarized electromagnetic fields, which are achieved in short high-frequency laser pulses, are of interest.

Projects in the theme:

	Name of the project	Project Leaders	Project code
1.	Microscopic models for exotic nuclei and nuclear astrophysics	V.V. Voronov A.A. Dzhioev	01-3-1136-1-2024/2028
2.	Low-energy nuclear dynamics and properties of nuclear systems	S.N. Ershov N.V. Antonenko	01-3-1136-2-2024/2028
3.	Quantum few-body systems	A.K.Motovilov V.S.Melezhik	01-3-1136-3-2024/2028
4.	Relativistic nuclear dynamics and nonlinear quantum processes	S.G. Bondarenko A.B. Larionov	01-3-1136-4-2024/2028

Projects:

	Name of the project Laboratory (Subdivision)	Project Leaders Responsible from laboratories
1.	**Microscopic models for exotic nuclei and nuclear astrophysics** BLTP	**V.V. Voronov** **A.A. Dzhioev** N.N. Arsenyev, E.B. Balbutsev, I.N. Borzov, H.G. Ganev, V.A. Kuzmin, L.A. Malov, M.A. Mardyban, I.V. Molodtsova, V.O. Nesterenko, A.P. Severyukhin, G. Stratan, A.I. Vdovin, P.I. Vishnevskiy

Brief annotation and scientific rationale:
The scientific Project aims to solve a fundamental task of contemporary nuclear physics – development and improvement of a self-consistent microscopic approach to describe the structure of ground and excited states of exotic and superheavy atomic nuclei, as well as to predict their decay properties. On the one hand, such an approach is necessary for planning the research program of modern heavy ion accelerator facilities (SHE-Factory at JINR, SPIRAL2 at GANIL, FAIR at GSI, RIBF at RIKEN) and for interpretation of their results. On the other hand, the need for reliable theoretical nuclear data is also relevant for modeling various astrophysical processes.

The self-consistent microscopic approach used in the Project to describe ground and excited nuclear states is based on the combination of the energy density functional (EDF) method and the quasiparticle-phonon nuclear model (QPM). The EDF has proven itself in global calculations of nuclear characteristics and in astrophysics. The use of the coupling of simple and complex configurations in the framework of QPM is nowadays practically the only way allowing one to go beyond the harmonic approximation using large configuration space without violating the Pauli principle.

Expected results upon completion of the project:
The form and parameters of the EDF will be extrapolated far beyond the stability valley. Special attention will be paid to isovector properties, which play a crucial role in nuclei with large neutron-proton asymmetry.

Using a unified set of EDF parameters, the effect of interaction between simple and complex configurations on the properties of charge-neutral and charge-exchange nuclear excitations will be investigated with respect to their resonance structure as well as on the decay characteristics of nuclei at the driplines.

The developed self-consistent EDF+QPM framework will be applied to study β-decay in the context of astrophysical r-process and weak nuclear reactions with hot nuclei in various astrophysical scenarios (supernova explosions, stellar nucleosynthesis, neutrino emission).

Prediction of α spectra of superheavy nuclei for planning future experiments. α-decays from isomeric states as well as fission from these states will be considered.

In order to determine the competition between different modes of radioactive decay of superheavy nuclei, lifetime calculations concerning orbital electron capture and β^+-decay will be carried out.

Analysis of the evolution of magic numbers as a function of the ratio of neutron to proton numbers in the nucleus and prediction of new nuclei with closed (sub)shells near the proton and neutron driplines.

Study of the role of tensor interaction in the fragmentation of the Gamow-Teller resonance and beta-decay of exotic nuclei.

Investigation of neutrino interaction with matter that is important in various astrophysical phenomena, e.g., supernovae, neutron star mergers, etc. The role of inelastic neutrino scattering on nuclei and the magnetic field in the neutrino thermalization process must be elucidated.

Calculations of charge and matter distribution radii for long isotopic chains, including deformed nuclei. Theoretical analysis of isotopic behavior of radii and observed anomalies.

Expected results of the project in the current year:
Investigation of low-energy states in No isotopes within the self-consistent random-phase-approximation with Skyrme forces.

Theoretical analysis of E1 and M1 excitations in deformed nucleus ^{156}Gd.

Fayans functional: consideration of relativistic corrections in the equations of state for symmetric nuclear and purely neutron matter.

Calculations of magnetic moments for the ground and isomeric states in long isotopic chains.

Refinement of conditions for the formation of superconducting pair correlations in spherical even-even atomic nuclei.

Study of the relationship between the double gamma decay of quadrupole states and the fine structure of the giant dipole resonance.

Analysis of the electric and magnetic dipole transitions in medium and heavy nuclei.

Study of the rigid- and irrotational-flow quadrupole dynamics of weakly deformed nuclei within the microscopic shell-model version of the Bohr-Mottelson model.

Study of the scissors mode in the even-even superheavy nuclei by the Wigner function moments method.

Calculation of the contribution of forbidden transitions into EC/β^+-decay of odd-odd nuclei in the α-decay chain of ^{288}Mc.

2. Low-energy nuclear dynamics and properties of nuclear systems	**S.N. Ershov** **N.V. Antonenko**
BLTP	G.G. Adamian, E.Kh. Alpomishev, A.V. Andreev, A.N. Bezbakh, J. Busa, R.V. Jolos, Sh.A. Kalandarov, E.V. Mardyban, A.K. Nasirov, R.G. Nazmitdinov, E.G. Nikonov, H. Pasca, A. Rahmatinejad, I.S. Rogov, V.V. Sargsyan, T.M. Shneidman, N.B. Shulgina, B.A. Urazbekov
MLIT	E.G. Nikonov

Brief annotation and scientific rationale:
The purpose of the project is to study the important dynamical nuclear processes such as fusion, quasifission, multinucleon transfers, capture and breakup. Investigations of the near threshold effects demand uniform description of the nuclear structure and reactions. Priority will be a development of cluster models that allow us to reveal peculiarities of the nuclear structure at extreme excitatios. A further development of the completely quantum models for decays of weakly bound nuclei is planned. The transport coefficients and nucleus-nucleus potentials calculated microscopically would be used in the double-folding model for a description of the fusion dynamics.

It is necessary to study in detail the influence of the environment on the rate of astrophysical reactions. This demands further development of the theory of the quantum systems. Thus, it is necessary to consider low-energy dipole excitations that play presumably a noticeable role in stellar nucleosynthesis.

Study of the nuclear properties depending on an energy is necessary to reveal effects outside the mean field description. In heated nuclei, the potential energy surface changes in such a way that the height of the fission barrier for superheavy nuclei decreases. Therefore, investigations of the shell effects damping with increasing energy are important for estimation of the stability of excited heavy nuclei.

Exploring the formation of superheavies with Z=119 and 120 in fusion reactions must be continued within a microscopic approach. Also, the peculiarities of the quasifission competing with the complete fusion will be considered. There are plans to compare the calculated mass distributions and TKE of the quasi-fission products with distributions of the fission products. New heavy ion isotopes, which cannot be obtained in the complete fusion reactions, can be formed by transfer reactions. Therefore, further theoretical analysis of these reactions by including a cluster transfer into the description is required. Investigations of the synthesis of new isotopes of superheavy nuclei must be continued in the evaporation channels of charged particles in order to search for the most suitable reactions for future experiments.

The advantage of the cluster approach is the simultaneous description of α-decay and spontaneous fission from the ground state of both even-even and even-odd nuclei with the same set of parameters. The main model assumption is that charge asymmetry as a collective coordinate is responsible for these processes. In the same approach, it is necessary to investigate fission from isomeric states and induced fission. Success in describing experimental data will lead to a new insight into fission process.

Expected results upon completion of the project:
Creation of new theoretical approaches and models for description and prediction of the properties of unstable nuclei and exotic nuclear systems and their application to astrophysical problems.

Explanation of the reaction mechanism with particles and nuclei within the broad energy interval.

Exploring the limits of nuclear stability, positions of proton and neutron drip-lines, detection of proton shell closure beyond Pb, and the best way to produce a certain isotope.

Study of fusion and fission dynamics providing benchmarks for confirming certain ways of fusion and fission.

Investigation of the influence of the environment on astrophysical reactions.

Study of the nuclear structure change with temperature and angular momentum, the role of cluster degrees of freedom in nuclear excitations, and the properties of superheavies.

Exploration of the properties of nuclear systems beyond the nucleon stability, the multineutron radioactive decay existence.

Expected results of the project in the current year:
Application of the collective Hamiltonian with an isovector pair and alpha-particle type correlations to describe the ground-state energies of even-even and odd-odd nuclei around ^{56}Ni.

Investigation of the structure of the superheavy nuclei belonging to the alpha-decay chain of ^{288}Mc.

Description of low-lying spectra of heavy nuclei using the collective equation obtained in the framework of the generator coordinate method and potentials calculated in the mean-field approximation.

Calculation of the properties of nuclei involved in nucleon transfer reactions leading to the synthesis of new isotopes. Investigation of the production of neutron-deficient isotopes of actinides.

Application of the DNS model to describe fusion-fission and quasifission reactions leading to actinide compound nuclei.

Solution of master equations that describe the fission of highly excited rotating heavy compound nuclei.

Description of the changes in the half-live times of shape isomers due to excited cluster states.

Description of the mass distributions and rate of ternary fission in nuclei near Z=100 with inclusion of the octupole deformation of fission fragments at the scission point.

Investigation of the fine structure of alpha-decay for different isotopes of Ra, Th, U, and Pu nuclei and study of the role of angular momentum dependence of the spectroscopic factors.

Calculation of the spectra of collective excitations of fissile nuclei at the scission point within the DNS model and analysis of the angular anisotropy of fission fragments in neutron-induced fission of various U and Pu isotopes.

Study of the structure of the heavy hydrogen ^{7}H in the ^{8}He(p,2p) reaction, taking into account peculiarities of the reaction mechanism and the structure of ^{8}He.

Study of the properties of giant monopole and quadrupole resonances within the Random Matrix approach.

Study of the effects of spin-orbit interaction on the transport properties of nanosystems.

Investigation of the impact of axial asymmetry on the state density and entropy along the fission paths of superheavy nuclei, e.g., ^{296}Lv by using the statistical method.

Calculation of neutron multiplicities, kinetic energy and mass distributions of fission fragments in spontaneous fission of transfermium nuclei with allowance for the evolution of the dinuclear system at the scission point.

Calculation of the yields of ^{209}Bi(γ,xn) photonuclear reactions and analysis of the role of pre-equilibrium neutron emissions.

Estimation of the contributions of the differential cross sections to the formation of reaction products of deep inelastic collisions, incomplete fusion and quasifission in the reactions ^{36}Ar+^{144}Sm, ^{68}Zn+^{112}Sn and ^{90}Zr+^{90}Zr.

Study of excitation energy dependence of potential energy surface for the heaviest nuclei.

Study of the role of various evaporation channels in Pb- and Bi-based fusion reactions.

3. Quantum few-body systems — **A.K. Motovilov**, **V.S. Melezhik**

BLTP	M.V. Egorov, D. Janseitov, E.A. Kolganova, V.N. Kondratyev, E.A. Koval, A.V. Malykh, Yu.V. Popov, V.V. Pupyshev, S.A. Rakityansky, S.A. Shadmehri, E.A. Solov'ev, D. Valiolda, S.I. Vinitsky, + 3 students
DLNP	O.I. Kartavtsev
MLIT	O. Chulunbaatar, A.A. Gusev
VBLHEP	A.A. Korobitsin

Brief annotation and scientific rationale:
The project is aimed at studying systems formed by a small set of constituents of nuclear, subnuclear or atomic-molecular origin. The smallness of the number of constituents in a system allows one to develop and use mathematically rigorous, precise and consistent approaches to its investigation, the approaches that do not require further simplifying physical assumptions and approximations. The goal of the project consists in developing and improving the methods of numerical solving of few-body problems in nuclear, atomic and molecular physics, and astrophysics. The developed approaches and methods will be employed in the numerical study of various concrete few-body quantum systems.

Expected results upon completion of the project:
Development of methods and approaches of the theory of few-body systems, settling some still remaining mathematical questions and issues. A contribution to Efimov physics with establishing new universal features in the behavior of ultra-cold few-body systems including the lattice few-body systems. Numerical calculations of ultracold three-atom systems in Efimov or pre-Efimov states by employing Faddeev equations. Theoretical study of non-stationary systems, in particular, the study of few-particle systems in varying external fields. Analysis of bound-state problems and scattering processes in low-dimensional few-particle systems. Development of the dynamical adiabatic theory and theory of hidden crossings of the potential-energy levels. Application of these theories to inelastic transitions in atom-atom collisions.

Expected results of the project in the current year:
Investigation of cluster features of light weakly bound nuclei at different collision energies.

Study of bound states and scattering processes in two- and three-atomic systems of rare gases.

Develpoment of a method for determining the field-free molecular orientation by two-color shaped laser pulses.

Investigation of multi-component few-body systems in the low-energy limit.

Investigation of acceleration and ionization of neutral atoms by electromagnetic pulses.

Extension of the a priori tan Θ theorem for spectral subspace of a self-adjoint Hamiltonian to unitary invariant norms.

Investigation of the influence of characteristics of colliding beams of photons and relativistic electrons on the magnitude of the differential and total cross sections for inverse Compton scattering.

Study of weakly bound states of a quantum particle moving in two-dimensional space.

Development of a method for calculation of extremely narrow resonances in binary collisions of quantum systems.

Investigation of canalized states in thin films.

Time-dependent analysis of the Coulomb and nuclear breakup reaction of halo nuclei on a light target.

4. Relativistic nuclear dynamics and nonlinear quantum processes

BLTP

S.G. Bondarenko
A.B. Larionov
M. Baznat, S.M. Dorkin, A.V. Frizen, L.P. Kaptar, V.K. Lukyanov, A. Parvan, A.I. Titov, V.D. Toneev, S.A. Yuriev

Brief annotation and scientific rationale:
The aim of the project is to study the universal laws in relativistic collisions of heavy ions accompanied by various particles production; determination of the most important observables to test the equation of state of the nucleus; theoretical support for experiments at the NICA complex. The large nuclear transparency compared to the predictions of Glauber-like models may indicate the presence of color transparency and should be carefully considered. Based on the generalized eikonal approximation, nuclear transparencies in *dd* collisions will be calculated, which are available at NICA SPD. It is planned to study three/four-nucleon bound (^{3}He,T,^{4}He) and scattering systems (elastic proton-deuteron) in the Bethe-Salpeter-Faddeev relativistic formalism. Study the properties of heated and compressed nuclear matter in the collision of heavy ions is based on the Nambu-Iona-Lasinio Polyakov loop model.

Our theoretical efforts are aimed at solving the following problems:
– improving transport approaches for describing the dynamics of relativistic collisions of heavy ions;
– identification of the most important observables in relativistic collisions of heavy ions to test the equation of state of the nucleus;
– study of the time of evolution of rapidly colliding systems to a local isotropic state in momentum space;
– study of the features of the interaction of high-energy gamma quanta with a strong laser field;
– consideration of relativistic effects in low-nucleon systems.

Expected results upon completion of the project:
Development of theoretical models and methods in the theory of nonlinear quantum processes of interaction of charged particles with intense electromagnetic fields. In this case, in addition to the dependence of observables on the field intensity, it is planned to study the polarization effects and the role of the shape and the carrier phase of the pulse.

Extension of the relativistic consideration of three-nucleon (^{3}He,T) systems in the formalism of the Bethe-Salpeter-Faddeev equation with separable interaction to four-nucleon systems in the Yakubovsky formalism (calculation of the ^{4}He binding energy, electromagnetic form factor of the system). Investigation of elastic proton-deuteron backscattering using the relativistic three-nucleon Bethe-Salpeter-Faddeev equation with a separable interaction kernel (taking into account nucleon rescattering diagrams). Consideration of the elastic electromagnetic form factor of the pion taking into account the anomalous magnetic moment of the quark in the framework of the covariant separable quark-quark interaction.

Study of the properties of heated and compressed nuclear matter in the collision of heavy ions. Of particular interest is the study of possible phase transitions that occur during the cooling of the system, as well as the problem of violation of CP invariance in strong interactions, which may be a consequence of the influence of the chiral anomaly on the topological structure of QCD vacuum in strong magnetic fields arising during the collision of heavy ions. The purpose of the study is to consider how the scattering cross section changes depending on the properties of the medium. Study of two-photon and Dalitz decays of light mesons within the NJL model at finite temperature and density. The production spectrum of dilepton pairs is directly related to various intermediate states of quark-hadron matter, and its study can provide information on phase transitions.

Investigations of the phenomenon of color transparency (CT), short-range nucleon-nucleon correlations and cumulative effect. Predictions for planned CPU search experiments at FAIR PANDA and NICA SPD. Based on the generalized eikonal approximation, taking into account the CT effects, we will calculate the nuclear transparency in the hard processes $d(d,2p)nn$ and $A(p,2p)$ with heavier nuclear targets (A >2) , for which the CT effects should be stronger.

Development of a solid theoretical basis for describing the interaction of a proton with a SRC pair in the nucleus, taking into account the NLS/VKD. Nucleon-nucleon short-range correlations (SRC) manifest themselves in interactions of high-energy particles with nuclei with sufficiently large momentum transfers (Q > 1 GeV).

Investigation of the influence of the nuclear medium on such fundamental characteristics of the elementary NN amplitude as the total cross section for scattering of a nucleon by a bound nucleon of the nuclear medium, the energy dependence of the ratio of its real part to the imaginary part, as well as its slope parameter depending on the momentum transferred to the nucleon bound in the nucleus.

Calculation of exact hadronic distributions in transverse momentum and rapidity by new methods within the framework of Tsallis-1, Tsallis-3 and q-dual statistics and their application to describe experimental data for hadrons produced in collisions of heavy ions and protons with protons at LHC, RHIC, NICA and FAIR energies. Generalization of the quantum-statistical hadron model with exactly conserved strangeness of the system to the case of exact conservation of the baryon and electric charges of the system and finding recursive equations for the exact solution of the partition function and ensemble averages. The use of this model to calculate the multiplicity of identified hadrons produced in heavy ion collisions at LHC, RHIC, NICA and FAIR energies.

Investigations of the behavior of ghost and gluon propagators at finite temperature in an approach based on the Dyson-Schwinger equation in the Landau gauge in the truncated rainbow approximation. It is planned to investigate possible phase transitions from a bound state of a glueball to a free gluon plasma for the problem of phase transitions to a quark-gluon plasma in a hot nuclear medium (in processes in experiments at the NICA facility).

Expected results of the project in the current year:
Study of polarization observables in nonlinear Compton scattering in the interaction of ultra-relativistic electrons with polarized intense laser pulses. Calculations related to the development of large laser centers in JINR member countries.

Construction of a relativistic approach for studying four-particle systems at high energies based on the Bethe-Salpeter and Faddeev-Yakubovsky equations and its application to the study of the ^{4}He nucleus, in particular, calculation of its binding energy and state amplitudes.

Study of the dependence of Y-meson cross sections in BB collisions on the properties of the medium in the framework of the covariant quark model with the SU(5) Lagrangian with anomalous interactions.

Calculation of nuclear transparency in the hard process $d(d,2p)nn$ based on the generalized eikonal approximation taking into account the effects of color transparency.

Analysis of proton-nucleus scattering data at energies of 100-1000 MeV in order to reveal the elementary amplitude of proton scattering on a bound nucleon of the nucleus.

Formulation of the local equilibrium statistical model with flows for the relativistic hadrons in the Boltzmann-Gibbs and Tsallis statistics to describe the transverse momentum distributions of hadrons created in proton-proton and heavy-ion collisions at high energies.

Study of possible phase transitions from a bound state of a glueball to a free gluon plasma.

Theory of Complex Systems and Advanced Materials

Theme leaders: V.A. Osipov
A.M. Povolotskii

Participating Countries and International organizations:
Armenia, Australia, Belarus, Brazil, Bulgaria, Canada, Egypt, Finland, France, Germany, India, Iran, Japan, Mongolia, Poland, Romania, Russia, Serbia, Slovakia, South Africa, United Kingdom, USA.

The problem under study and the main purpose of the research:
The most important directions of fundamental research will be theoretical studies of physical phenomena and processes in condensed matter, studies of the properties of new advanced materials, constructing and analysis of theoretical models and the development of analytical and computational methods for their solution. Complex materials such as high-temperature superconductors, magnetic materials, smart composite materials, fractal and layered structures are supposed to be studied and a wide class of systems with strong electronic correlations will be analyzed. Theoretical research in this area will be aimed at supporting the experimental study of these materials carried out at the Frank Laboratory of Neutron Physics, JINR. It is planned to conduct research in the field of physics of nanostructures and nanomaterials, in particular, using the software packages for modeling physical and chemical processes and for analysis of physical characteristics. First of all, these are modern two-dimensional materials such as graphene, transition metal dichalcogenides, etc., including their modification and chemical functionalization for a subsequent use in the design of new devices for nanoelectronics, spintronics, etc. Partly, these studies are focused on experiments held at the FLNR Center for Applied Physics JINR, Centre "Nanobiophotonics" at FLNP JINR, the Institute of Semiconductor Physics SB RAS and a number of other laboratories of the JINR Member States. The physical properties of stacks of Josephson junctions and various Josephson nanostructures will be studied in detail. Much attention will be paid to the analysis of both lattice and field models of equilibrium and nonequilibrium systems of statistical mechanics. The concepts of scaling and universality allow one to go beyond the model approach and apply the results obtained to broad classes of phenomena studied in the physics of condensed matter. Studies of a wide range of universal phenomena in complex systems - phase transitions in condensed matter and high-energy physics, scaling in (magneto)hydrodynamic turbulence, chemical reactions, percolation, etc. by the methods of quantum field theory including the functional renormalization group are supposed to be carried out.

Brief annotation and scientific rationale:
Enormous recent progress in both the art of sample preparation and the measurement techniques has produced a wealth of high quality data on thermodynamic, transport, structural and spectroscopic properties for new complex materials that exhibit unconventional forms of magnetism, showing evidence for strong electronic and magnetic correlations, or having fractal properties at nano and microscales. These materials attract now considerable attention for various applications, e.g., in quantum computing or in describing the physical and chemical properties of colloids, biological systems, granular materials etc.

Expected results upon completion of the project:
Estimation of the exchange parameters of Kitaev materials based on transition and rare-earth metals and calculation of their spin-wave spectrum.

Magnetic phase diagrams in strongly-correlated electronic systems within the t-J model for electron doping.

Explaining the structure of systems of dense random packings in nano- and micro-materials.

Development and application of quantum algorithms for computational problems in condensed matter physics and quantum chemistry.

Development of a theory of stability for mixtures of quantum fluids.

Understanding the irradiation resistance of various compounds.

Expected results of the project in the current year:
Estimation of exchange integrals in a novel cobalt-based pyroxene.

Magnon spectrum in a ferromagnetic state of anisotropic-exchange model on a triangular lattice.

Development of a theory of nonlinear coherent modes in trapped clouds of Bose atoms.

Analysis of the possibility of generating squeezed and entangled states in optical lattices for quantum information processing.

Refining the methods of regulating magnetization dynamics in nanomaterials and their application for creating memory devices.

Dielectric control of Rydberg excitons in atomically thin semiconductors.

Implementation of quantum algorithms on simulators with classical computing architecture for the numerical study of the electronic and magnetic structures of molecular complexes and crystalline fragments of new functional materials with strong electronic correlations.

Numerical investigation of the structure of oxides (TiO_2, Sc_2O_3) relevant for nuclear quadrupole interaction experiments.

Self-consistent calculations of the short-range correlations in trapped Bose gases and the confinement-induced resonances in one and two dimensions.

Correlation properties of dense random packing systems with a power-law distribution of their sizes in thermodynamic limit.

2. Mathematical models of statistical physics of complex systems	**A.M. Povolotsky**
BLTP	G.Y. Chitov, V.I. Inozemtsev, V.V. Papoyan, P.N. Pyatov, V.P. Spiridonov

Brief annotation and scientific rationale:
Non-perturbative studies of large-scale systems with many interacting degrees of freedom constitute an important part of modern theoretical physics that has been experiencing a growing interest of researchers during the last decade. Recent advances in this direction are based on the construction and investigation of exactly solvable models of equilibrium and non-equilibrium statistical physics, quantum mechanics and related quantum field theories. Then, with the use of the concepts of scaling and universality the results obtained from the exact solutions can be extended to vast classes of physical phenomena far beyond the realm of such systems. The exact solvability of models of physical systems is provided by their special mathematical structure coined by the term integrability. The models with such a structure is the major subject of studies within the current project.

The project is aimed at further exploration of the field of exactly solvable models of statistical physics, quantum mechanics and quantum field theories, which requires a development of new theoretical tools based on the theory of integrable systems and discovery of new mathematical structures standing behind the exact solvability. The main objectives of the project consist in obtaining exact results about universal laws in interacting particle systems with stochastic dynamics and models of random interface growth, models of equilibrium statistical physics including percolation, polymers and other two-dimensional lattice models and quantum spin chains, studies of known and construction of new types of special functions playing the role of building

blocks in the theory of integrable systems and computations of partition functions (superconformal indices), studies of known and construction of new algebraic structures standing behind the integrability concept.

Expected results upon completion of the project:
Construction and complete classification of one-dimensional stochastic models of interacting particles based on representations of Hecke algebras and related two-dimensional lattice models of interacting paths, as well as obtaining their exact solutions using the Markov duality methods.

Calculation of exact cluster densities and their asymptotic expansions in percolation models, as well as loop densities in associated densely packed loop models on lattices with different boundary conditions, construction of asymptotic expansions of thermodynamic quantities characterizing the behavior of free-fermionic models on lattices of finite size, such as dimers, Ising model and spanning tree models with different geometry under various boundary conditions. It is also planned to study the boundary behavior of nonlocal correlation functions in models of dense polymers and spanning trees, as well as to describe the limiting forms and universal fluctuations of polymer configurations in these models.

Application of the studied models of polymers and quantum spin chains to problems from related fields of quantum mechanics and biophysics. Among them are the studies of "entangled states" and magnetic properties of complex quantum spin systems related to the problems of quantum computing, the use of a rotor-router model (Eulerian walks) to study the dynamics of double-stranded DNA breaks.

Development of mathematical structures behind the integrability. In particular, further study of the properties of elliptic beta integrals and elliptic hypergeometric functions and their various limiting forms, new applications of these functions to quantum field theory, quantum and statistical mechanics and soliton theory, construction of complex hypergeometric functions on root systems in the Mellin-Barnes representation and study of their connections to the two-dimensional conformal field theories. Finding generalized modular transformations for elliptic hypergeometric integrals and description of their consequences for superconformal indices (statistical sums) of four-dimensional supersymmetric field theories. It is also planned to generalize the obtained results to the cases of rarefied hypergeometric functions of various types and describe the relevant physical systems, as well as to investigate connections between soliton solutions of integrable equations, lattice Coulomb gases, non-local Ising chains and ensembles of random matrices.

Construction and study of new algebraic structures underlying integrability and their use for constructing new integrable systems that could be useful in various applications. Generalization of the Hamilton-Cayley theorem to the case of orthogonal type quantum matrix algebras and study of the subalgebra of spectral values of orthogonal quantum matrices. Construction of an analogue of the Gauss expansion in the reflection equation algebras, and development of the representation theory of these algebras.

It is also planned to study a series of R-matrix solutions of the braid relation, which make it possible to model stochastic reaction-diffusion processes and study the possibility of constructing new link/knot invariants using new series of R-matrices.

Expected results of the project in the current year:
Classification of interacting particle systems with stochastic generators based on R-matrix representations of infinite Hecke algebra construction of Markov dualities in them.

Calculation of exact loop densities on O(1) dense loop model on the infinite cylinder of odd circumference and of related densities of critical percolation clusters in half-turn self-dual percolation.

Construction and solution of integrable model of lattice paths with partial annihilation.

Description of the finite-dimensional behavior of a dimer model on a lattice with cylindrical boundary conditions.

Studies of "entangled states" and magnetic properties of quantum spin chains with single-ion anisotropy and the Dzyaloshinskii-Moriya interaction.

Application of the rotor-router model (Eulerian walk) to describe the dynamics of recovery of double-stranded DNA breaks.

Calculation of the ground-state phase diagram, which includes quantum phase transitions, modulation transitions (disorder lines), and the lines of disentanglement, for the dimerized *XYZ* chain.

Explanation of cascades of percolation transitions for models of the type of cellular automata or contact processes from the analysis of Lee-Yang zeros of generalized partition functions of stationary states of non-equilibrium models and establishing the relation between the appearance of a critical point of a geometric transition and the properties of the spectrum of the transfer matrix of the corresponding model.

Construction of a new rarefied elliptic gamma function describing superconformal index of the chiral superfield for the models related to a special series of the lens spaces, as well as computation of the corresponding rarefied elliptic beta integral, which confirms Seiberg duality of the simplest supersymmetric gauge theories on such spaces.

Construction of the complex hypergeometric integrals on the root systems in the Mellin-Barnes representation, and consideration of the quasiclassical limit for them, connected to the two-dimensional conformal field theory. Investigation of the asymptotics of the Frenkel-Turaevsum, when the parameter of truncation of the corresponding elliptic hypergeometric series N goes to infinity.

Derivation of the Cayley-Hamilton theorem for the family of orthogonal type quantum matrix algebras. Detailed analysis of the spectrum of the quantum orthogonal matrices.

Construction of finite dimensional irreducible representations and investigation of the Hopf structure of the GL-type reflection equation algebras in their quasi-oscillator presentation.

3. Nanostructures and nanomaterials	**V.A. Osipov** **E.A. Kochetov**
BLTP	M. Abdelghani, D. Anghel, T. Belgibaev, V.L. Katkov, K.K. Kesharpu, S.E. Krasavin, K.V. Kulikov, N.L. Matsko, A.A. Mazanik, I.R. Rahmonov, I.K. Sobolev, Yu.M. Shukrinov
MLIT	I. Sarhadov, S.I. Serdyukova, E.B. Zemlianaya
FLNP	G.M. Arzumanyan
FLNR	V.A. Skuratov
LRB	A.N. Bugay

Brief annotation and scientific rationale:
It is planned to conduct research in the field of physics of nanostructures and nanomaterials, in particular, using the software packages for modeling physical and chemical processes and for analysis of physical characteristics. First of all, these are modern two-dimensional materials such as graphene, transition metal dichalcogenides, etc., including their modification and chemical functionalization for a subsequent use in the design of new devices for nanoelectronics, spintronics, etc. Partly, these studies are focused on experiments held at the FLNR Center for Applied Physics JINR, Centre "Nanobiophotonics" at FLNP JINR, the Institute of Semiconductor Physics SB RAS and a number of other laboratories of the JINR Member States. It is planned to analyze topological superconductivity in strongly correlated electronic systems in order to find possible applications for the transmission and storage of quantum information. The physical properties of stacks of Josephson junctions and various Josephson nanostructures will be studied in detail.

The main goal of the project is a theoretical study of the properties of new promising materials, primarily nanostructures and nanomaterials. This is explained not only by the fundamental nature of the physical properties of these materials but also by their practical importance for designing new electronic devices, as well as devices for storing, processing and transmitting information, sensors and biosensors, and others.

Expected results upon completion of the project:
The project is aimed at solving tasks in the following areas:
in order to identify materials with promising properties for use as a component base for a new generation of electronics, it is planned to study thermal and electron transport in low-dimensional materials of various configurations and chemical composition. An analysis will be made of the role of functionalization, structural modification, the influence of thin layers, polycrystalline, structural defects, and other factors. Experimental studies are carried out in cooperation with the Educational and Scientific Technological Laboratory "Graphene Nanotechnologies" NEFU in Yakutsk (synthesis), the Institute of Semiconductor Physics SB RAS (synthesis, characterization, functionalization), FLNP JINR (chracterization, functionalization, irradiation) and FLNR JINR (ion irradiation to create nanopores).

Analysis of topological superconductivity in strongly correlated electronic systems in order to search for possible applications for the transmission and storage of quantum information and for the study of non-standard quantum transport that is insensitive to local noise sources.

Study of dynamic, transport and chaotic phenomena in hybrid Josephson nanostructures with magnetic materials for the purposes of superconducting spintronics. Modeling of quantum phenomena in Josephson qubits (memory elements).

Study of the properties of polarons in low-dimensional materials and nanostructured objects. Analysis of plasmon-phonon interaction and plasmons in nanoscale and massive objects.

Expected results of the project in the current year:
Study of the interaction of superconductivity and magnetism in Josephson hybrid structures. Analysis of the influence of a domain wall motion in a ferromagnetic layer on the dynamics of solitons in the Josephson junction. Investigation of the interaction of magnetic excitations of the domain wall type with solitons arising in a long Josephson junction.

Study of the influence of temperature on the band structure and transport characteristics in various functionalized nanostructures such as graphene and carbon nanotubes. Analysis of electronic transport properties of 2D systems from density functional band-structure calculations.

Study of the electronic transport in polycrystalline nanomaterials including graphene. Analysis of the impact of grain boundaries on resistivity in semiconducting and semimetalic materials.

Study of topological superconductivity induced by strong electron correlation. Analysis of the effect of the strong electron correlation on the properties of the topological superconductor.

4. Quantum Field Theory Methods in Complex Systems — **M. Hnatič**

BLTP	L.Ts. Adzemyan, N.V. Antonov, G.A. Kalagov, M.V. Kompaniets, N.M. Lebedev, L. Mižišin, Yu.M. Molotkov, M.Yu. Nalimov, L.A. Sevastyanov
MLIT	J. Buša

Brief annotation and scientific rationale:
Complex physical phenomena such as developed turbulence, transport phenomena, non-equilibrium phase transitions, percolation, chemical reactions and surface growth in random media are difficult to study theoretically and experimentally; however, in the light of their wide distribution in nature such studies prove themselves to be very valuable.

The main task of the project will be the formulation of the corresponding theoretical models, which can be investigated using the methods of quantum field theory and non-equilibrium statistical physics. The main goal is to study the statistical characteristics of fluctuating fields in the region of large spatial scales, identify phase transitions and to calculate universal critical exponents and non-universal amplitudes.

Dynamic nonlinear systems in which non-equilibrium (stochastic) fluctuations of physical quantities play a decisive role, is one of the most important research topics by leading scientific teams in the world. They cover a wide range phenomena, which we observe in the world around us.

Notable examples of stochastic processes include: hydrodynamic and magneto-hydrodynamic turbulence, describing, in particular, turbulent movements in the Earth's atmosphere and oceans, the spread of pollutants in them (including chemically active), as well as chaotic motions of plasma on the surface of the sun and in space. One of the important consequences of the existence of mechanical instabilities in electrically conducting turbulent media is an exponential growth of magnetic fluctuations leading to the formation of observed nonzero averaged magnetic fields only due to the kinetic energy of the turbulent medium.

Another important example of stochastic systems is percolation processes. They describe phenomena such as seepage in porous media, filtration, spread of infectious diseases, forest fires and others. Their universal feature is the existence of a non-equilibrium phase transition to an inactive (absorbing) state that extinguishes all activity of the observed system. Obviously, the study of transitions between a stationary active and the inactive phase is of great practical importance.

The main object of the study is physical quantities that depend on space-time coordinates and therefore are fluctuating fields, and the measured quantities are their statistical averages. The most important of them are non-zero average field values, response functions, multipoint correlation functions, two-point simultaneous correlations (structural functions), including composite fields (operators). In the region of large spatial and temporal scales, their scaling behavior with universal critical exponents is observed. The analysis of stability regions of scaling regimes and the calculation of indices is a priority goal in the study of stochastic nonlinear systems.

The main goal of the project is to study stochastic nonlinear dynamic systems such as developed (magneto)hydrodynamic turbulence, non-equilibrium phase transitions, phase transitions in systems with high spins, kinetics of chemical reactions, percolation processes, surface growth in random media and self-organized criticality.

Expected results upon completion of the project:
Investigation of the crossover in systems of multicomponent fermions within the BEC-BCS functional renormalization group: analysis of phase diagrams and calculation of transition temperatures to the ordered state. Approbation and adaptation of computational methods for solving non-perturbative equations of the functional renormalization group.

Development of computational methods for calculating the contributions of multi-loop diagrams to the renormalization group functions of dynamical models. Investigation of the dynamics of the superconducting phase transition in low-temperature superconductors.

Study of the effects associated with the violation of mirror symmetry in magneto-hydrodynamic developed turbulence. Calculation of two-loop Feynman diagrams generated by the Lorentz force and two-loop diagrams of the response function leading to an exponential growth of magnetic field fluctuations in the region of large scales. Study of the phenomenon of turbulent dynamo.

Construction of effective field-theoretical models of chemical reactions of various types of particles occurring in random media. Study of the infrared scaling behavior of statistical correlations of particle densities by renormalization group methods.

Study of isotropic and directed percolation. Calculation of multi-loop Feynman diagrams generating ultraviolet divergences. Finding fixed points of the renormalization group equations and calculating critical exponents for physically significant and experimentally observable quantities - response functions, density of active nodes (agents), effective radius and mass of active zones.

Study of the effect of isotropic motion of a medium with different statistical characteristics on the possibility of anisotropic scaling in the Hua-Kardar self-organized criticality model. Investigation by the functional renormalization group method of possible asymptotic regimes corresponding to the non-universal scaling behavior of a surface growing in a random environment and described by a model that includes an infinite number of types of interactions.

Expected results of the project in the current year:
Investigation of the superfluid phase transition in the SU(n) symmetric model in the framework of the functional renormalization group at finite temperatures.

Investigation of statistical correlations of magnetic fluctuations in the model of stochastic magnetic hydrodynamics with broken mirror symmetry in the two-loop approximation. Calculation of the value of the spontaneously generated homogeneous mean magnetic field.

Analysis of the behavior of governing fields in isotropic percolation near the point of second-order phase. Calculations of critical exponents in the two and three-loop approximation.

Four-loop renormalization group calculations in a stochastic model of devolved turbulence.

Investigation of the effect of medium motion on a system with self-organized criticality described by the stochastic Hua-Kardar model. Finding possible types of critical behavior and the area of their stability. Calculation of the corresponding critical exponents in the leading order of perturbation theory.

Calculation of the critical index of the viscosity coefficient at the transition to the superfluid state within the framework of the generalized model A.

Modern Mathematical Physics: Integrability, Gravity and Supersymmetry

Theme leaders: A.P. Isaev
S.O. Krivonos

Participating Countries and International organizations:
Armenia, Australia, Brazil, Bulgaria, CERN, China, Czech Republic, France, Germany, Greece, Iran, Ireland, Israel, Italy, Japan, Poland, Portugal, Russia, Serbia, Spain, United Kingdom, USA.

The problem under study and the main purpose of the research:
The main task of the Theme is the development of mathematical methods for solving the most important problems of modern theoretical physics, namely: development of new mathematical methods for studying and describing a wide class of classical and quantum integrable systems and their exact solutions; analyzing and searching for solutions to a wide range of problems of supersymmetric theories, including models of strings and other extended objects; study of nonperturbative regimes in supersymmetric gauge theories; development of cosmological models of the early Universe, gravitational waves and black holes.

Projects in the theme:

	Name of the project	Project Leaders	Project code

Brief annotation and scientific rationale:
Our project is devoted to important problems of modern mathematical physics. The three most important investigation directions of the project are the study of holographic duality, construction of supersymmetric theories and description of unitary irreducible representations of Poincare groups in higher dimensions. Each of these directions can be regarded separately but in our project we concentrate our attention on the problems which lie on the borders of these major directions. As byproducts, we study certain applied problems, including those that arise in connection with booster thematic.

Expected results upon completion of the project:
The first problem of the project is the study of algebraic and differential structures in holographical systems, which belongs to the subject of modern mathematical physics considered in the context of holographic duality. This part of the project is focused on the study of properties of integrable systems appearing in holographical models.

The second problem is devoted to the construction of an action of the non-Abelian N=(1,0), d=6 tensor multiplet possessing as many as possible numbers of properties of six dimensional superconformal theories. This problem is related to the first one since it is devoted to field theories with extended supersymmetry which are very important in the mathematical physics studies since they help to describe common properties of quantum fields theories and many aspects of the string theory.

The third problem of our project arises in the context of studies of the models with higher spin fields requiring a certain description of unitary irreducible representations of Poincare groups and symmetry groups of AdS spaces. According to Wigner, each irreducible representation of the four-dimensional Poincare group is assotiated with an elementary particle (field). This conception is generalized to the case of arbitrary dimension and to the case of other groups including supergroups. Therefore, when studying different field models, one first of all asks the question of classification and explicit construction of unitary irreducible representations of the symmetry group of the studied theory.

Expected results of the project in the current year:
Universal formulas will be constructed for the projectors onto invariant subspaces and eigenvalues of the split Casimir operator in the tensor product of four adjoint representations of simple Lie algebras and superalgebras. Universal formulas will be found for the eigenvalues of higher Casimir operators in the representations included in the tensor cube of the adjoint representation of simple Lie algebras and superalgebras. The color factors of Feynman diagrams in quantum gauge field theories will be found.

The superfield action of the N=(1,0), d=6 tensor multiplet in harmonic superspace will be constructed, which includes interaction with a non-abelian gauge field in the framework of tensor hierarchy, and it will be found what expected properties of six-dimensional superconformal field theory are satisfied.

For a 3d supergravity model, a holographic RG flow at finite temperature corresponding to a black hole solution will be constructed. Using the mapping onto the Poincare sphere, the stability of holographic RG flows will be investigated. It is also planned to calculate thermodynamic quantities and investigate the phase diagram corresponding to the RG flow.

Using the method of the generalized Wigner operator, local relativistic fields will be constructed, on which unitary irreducible massless helicity representations of the 4D Poincaré group are realized. It is planned to build objects corresponding to gauge potentials (using an auxiliary “index” 4-vector variable) and objects corresponding to field strengths (using auxiliary commuting Weyl spinors).

2. Supersymmetry, Higher Spins, Gravity	**E.A. Ivanov** *Deputy:* **S.A. Fedoruk**
BLTP	I.L. Buchbinder, A.P. Nersessian, G.A. Sarkissian, Ya.M. Shnir, S.S. Sidorov, A.O. Sutulin, N.M. Zaigraev

Brief annotation and scientific rationale:
The project is aimed at solving fundamental problems of modern theoretical physics associated with the development of superfield methods in gauge theories with extended supersymmetry in various dimensions, including extended supersymmetric mechanics. The implementation of the project includes the construction of new field and quantum-mechanical models with global and gauge symmetries, the development of new, including geometric, methods for studying the structure of these models at the classical and quantum levels, the study of the structure of the corresponding quantum effective actions and classical solutions of these models, including black holes. All tasks of the project are set by the modern development of theoretical physics and are organically joined by the unity of methods and approaches.

Expected results upon completion of the project:
Calculating all leading and subleading in the dimensional regularization parameter two-loop counterterms in 6D, N=(1,0) and N=(1,1) supersymmetric gauge theories.

Constructing a one-loop induced effective action in the theory of hypermultiplet interacting with N=2 supergravity in the harmonic superspace approach.

Development of the methods of calculation of the one-loop induced effective action in the theory of hypermultiplet coupled to external fields of N=2 harmonic gauge superfields.

Derivation of 4D, N=2 harmonic superfield formulation for N=2 supersymmetric gauge fermionic higher spin fields.

Working out 4D, N=2 superfield gauge theory of higher spin fields in the AdS space.

Development of effective methods for describing gauge fields and superfields of an infinite spin in an arbitrary space-time dimension.

Finding Lagrangians describing the interactions of infinite spin fields and higher spin fields with fields of a fixed spin.

Finding out superfield harmonic Lagrangians of sigma models obtained by T-duality from 2D, N=(4,4) supersymmetric hyperkahler and quaternion-kahler sigma models.

Building a superfield matrix formulation of new N=4 and N=8 supersymmetric extensions of integrable many-particle systems and their quantization.

Construction of new models of N-extended supersymmetric quantum mechanics by using the superfield gauging method, which describe the interaction of dynamic and semidynamic multiplets of various types.

Construction and study of N=4 models of supersymmetric mechanics based on the interaction of linear and nonlinear supermultiplets with the component content (4,4,0), (3,4,1) and (2,4,2).

Constructing the Hamiltonian formulation and performing quantization of the generalizations of systems with the nonlinear (2.4.2) supermultiplet.

Constructing an extension of N=4 supersymmetric mechanics with (3.4.1) supermultiplet to the class of systems parametrized by an arbitrary holomorphic function.

Construction and study of many-particle systems with nonlinear supermultiplets.

Construction of a superfield description of Calogero-type models with extended N≥4 supersymmetries.

Analysis of the integrability of N-extended supersymmetric systems of the Euler–Calogero–Moser and Calogero–Moser–Sutherland types for the A(n-1) series of the Coxeter group.

Finding an explicit form of the functionally independent conserved Liouville currents in N=2 supersymmetric Calogero models for all root systems of Coxeter groups.

Construction of two new exactly calculated rarefied elliptic beta integrals associated with special lens spaces and a special subgroup of the modular transformations group SL(2,Z).

Computation of a matrix of modular transformations of one-point conformal blocks on a torus in the Neveu-Schwarz sector of the N=1 superconformal Liouville field theory, based on the expression of this matrix as an integral of the product of certain elements of the fusion matrix.

Obtaining the difference equations for the fusion matrix in the Neveu-Schwarz sector of the N=1 superconformal Liouville field theory.

Finding a new class of solutions of GR with gauge multicomponent matter fields in models with spontaneous symmetry breaking.

Constructing and exploring a new class of solutions of extenged Einstein gravity with the Chern-Simons term that represents stationary rotating black holes.

Expected results of the project in the current year:
Construction of a theory of N=2 higher spin superfields against the AdS_4 superbackground.

Calculation of the quantum effective action of the hypermultiplet induced by interaction with higher-spin N=2 gauge superfields.

Construction and study of a new class of solutions of GR with multicomponent gauge matter fields in models with spontaneous symmetry breaking.

Finding the Lagrangians describing free infinite spin(super)fields using the twistor approach and BRST methods Construction of the minimal interaction of infinite spin fields and higher spin fields with the fixed spin fields.

Construction and study at the classical and quantum levels of new N=4 and N=8 supersymmetric matrix systems with extended deformed supersymmetry and matrix systems of superconformal mechanics.

Hamiltonian formulation and quantization of systems with the generalization of (2.4.2) nonlinear chiral supermultiplet suggested in the article by S. Bellucci, A. Nersessian, Phys. Rev. D 73, 107701 (2006).

Compution of the matrix of modular transformations of one-point conformal blocks on the torus in the Neveu-Schwarz sector of 2D N=1 superconformal Liouville field theory.

Derivation of difference equations for the fusion matrix in the Neveu-Schwartz sector of the 2D N=1 superconformal Liouville field theory.

Obtaining a superconformal index of the 4D N=1 superconformal field theory on general lens space and calculation of its rarefied beta integral.

Construction of models of the N=4 supersymmetric mechanics with spin degrees of freedom based on the interaction of linear and nonlinear supermultiplets.

Construction of a supersymmetric generalization of the Euler-Calogero-Moser model for an arbitrary number of particles and study of its integrability and superintegrability in the case of N=2 supersymmetry.

3. Quantum gravity, cosmology and strings	**I.G. Pirozhenko** **D.V. Fursaev**
BLTP	E.A. Davydov, V.V. Nesterenko, A.B. Pestov, A.S. Sorin, V.A. Tainov, P.V. Tretyakov

Brief annotation and scientific rationale:
The project is aimed at solving the fundamental problems of classical and quantum gravity and conducting advanced theoretical research at the national and world level in this area at BLTP JINR. In classical gravity, the project is focused on studying all kinds of gravitational wave phenomena, including shock waves in General Relativity, as well as various sources of gravitational wave background such as cosmic strings. One of the directions of the project is the elaboration of cosmological models that explain the properties of the observable Universe based on field theory methods and modified gravity. In the field of quantum gravity, it is planned to develop an apparatus of quantum field theory in an external classical gravitational background and new methods for an approximate estimation of the effective gravitational action in various regimes. Asymptotic symmetries in gravity, the relationship between gravity, thermodynamics and quantum entanglement, the holographic properties of gravity, and the AdS/CFT correspondence will also be explored.

Expected results upon completion of the project:
Development of field theory methods against the background of shock gravitational waves using the method of supertranslations at the wave front; study of classical field effects induced by shock waves, including the astrophysical applications.

Study of classical effects in the gravitational field of shock gravitational waves, including the case of the gravitational field induced by null cosmic strings (cosmic strings moving at the speed of light); study of gravitational (electromagnetic) radiation induced by the motion of null cosmic strings near massive (charged) sources, estimation of the parameters of these objects corresponding to the observed characteristics of induced radiation.

Study of physical effects associated with the formation of caustics and other defects on the world sheet of the null cosmic string as possible sources of gravitational bursts; development of the holonomy method proposed for describing free classical fields against the background of a gravitational shock wave.

Quantization and study of quantum effects in the gravitational field of shock gravitational waves, calculation of the expectation value of the renormalized energy-momentum tensor.

Derivation and study of the properties of exact solutions of the Einstein equations related to the subject of this project, for example, the search for non-trivial solutions that have global hyperbolic isometry and allow the introduction of holonomy associated with these transformations.

Study of the gravitational entropy associated with various surfaces in Riemannian geometry, in particular, study of the entropy formed when the light cones of the past and future (causal diamonds) intersect, as well as study of quantum corrections and renormalization of this quantity.

Further development of spectral geometry methods applied to nonlinear spectral problems; using these methods to study the finite-temperature QFT on stationary manifolds of a general form, as well as the application of this theory to calculate the effects of quark-gluon matter taking into account rotation and acceleration.

Study of cosmological models of modified gravity, an attempt to explain on their basis the key characteristics of the observed cosmology such as the accelerated expansion of the Universe; the study of cosmological perturbations in a teleparallel theory with a non-minimal scalar-tensor coupling, where the main object is the torsion scalar, in contrast to general relativity, where the main object is the Ricci scalar.

Construction of integrable cosmological potentials for spatially flat cosmologies with one scalar field for searching and constructing realistic completely integrable inflationary models with a phase transition; study of phase transitions in quantum theory, including gravity, and the formation dynamics of walls separating regions with different field values, the development of the thick-wall approximation method taking into account gravity, as well as the construction and study of exactly solvable inflationary models with phase transitions.
Development of methods in the framework of the Picard-Lefschetz theory and their application for calculating Lorentz path integrals in problems of quantum field theory, gravity and cosmology, and, in particular, in problems of describing the lensing of gravitational waves.

Expected results of the project in the current year:
Calculation of an aproximate stress-energy tensor for weak high frequency waves in f(R) gravity against an arbitrary curved space-time background, which is not an obligatory solution of this vacuum f(R) gravity, using Aizekson method for high frequency waves in Einstien gravity. A possible application of this result is to take into account the back reaction from previously borned scalarons on evolution of dark energy in the Starobinsky and Hu-Sawicki gravity models.

Investigation of classical effects against the background of shock gravitational waves, the special cases of which are the gravitational fields of massless ultrarelativistic particles and null cosmic strings. Quantitative estimates of these effects will be made and the possibility of their observation in gravitational experiments will be studied.

The method of soldering two metrics together across null hypersurfaces will be used to find new solutions in the general relativity, which can be interpreted as gravitational shock waves. The geometry and physical properties of these null surfaces will be investigated. The results will be formulated in the language of Carrollian symmetry groups. The asymptotic BMS supertranslation charges will be found.

Revision of quantum field theory against the classical backgound of a gravitational shock wave and study of quantum effects in this spacetime; calculation of the expectation value of renormalized stress-energy tensor.

Elementary Particle Physics and High-Energy Heavy-Ion Physics (02)

Participation in international experiments

02-1-1066-2007

Investigation of the Properties of Nuclear Matter and Particle Structure at the Collider of Relativistic Nuclei and Polarized Protons

Theme leaders: R. Lednicky
Yu.A. Panebrattsev

Participating countries and international organizations:
Azerbaijan, Bulgaria, Czech Republic, France, Germany, Poland, Russia, Slovakia, USA.

The problem under study and the main purpose of the research:
Investigation of the properties of nuclear matter with extremely high density and temperature, search for the signatures of the quark deconfinement and possible phase transitions at the collisions of heavy nuclei at the energies of the Relativistic Heavy Ion Collider (RHIC). Measurement of spin dependent structure functions of nucleons and nuclei using polarized proton beams at RHIC.

Project in the theme:

	Name of the project	Project Leaders	Project code
1.	STAR	Yu.A. Panebrattsev R. Lednicky	02-1-1066-1-2010/2024

Project:

	Name of the project Laboratory (Subdivision)	Project Leaders Responsible from laboratories	Status
1.	**STAR**	**Yu.A. Panebrattsev** **R. Lednicky**	Realization
	VBLHEP, MLIT, BLTP, UC	the list of participants is given in Activities	

Brief annotation and scientific rationale:
Investigation of the properties of nuclear matter with extremely high density and temperature, search for the signatures of the quark deconfinement and possible phase transitions at the collisions of heavy nuclei at the energies of the Relativistic Heavy Ion Collider (RHIC). Measurement of spin dependent structure functions of nucleons and nuclei using polarized proton beams at RHIC.

Expected results upon completion of the project:
1. Obtaining information about the properties of excited nuclear matter. Participation in experiments with nuclei and polarized protons at the STAR facility at the RHIC nuclear collider at BNL.
2. Measurement at the STAR facility of spin effects in experiments with polarized protons. Obtaining new information about the spin – dependent distribution functions of quarks and gluons in the proton.
3. Research of femtoscopic correlations, structure of events and scaling properties of nuclear interactions, global polarization, events with wide transverse momenta.
4. Conducting experiments on the Beam Energy Scan program BESII in the collider mode and in the fixed target mode. Search for signatures of phase transitions and critical points of QCD.
5. Development of the STAR detector software and creation of corresponding infrastructure at JINR for processing and analysis of experimental data of the STAR facility at JINR.
6. Creation of the joint educational programs in relativistic nuclear physics and physics of the microworld together with BNL and JINR member states universities.

Expected results of the project in the current year:

1. Beam Energy Scan-II data analysis for collider mode and fixed target measurements.
2. Study of spin effects in collisions of transversely polarized protons at 510 GeV and forward rapidities.
3. Study of event structure, collective variables, correlation characteristics, femtosopic correlation functions and high-p_T processes.
4. Study of future possibility of investigation of the nuclear structure and the proton spin in *e*-*p* and *e*-A collisions at colliders.
5. Participation in joint educational programs in relativistic nuclear physics with BNL and universities of the JINR Member States. Development of JINR educational portal.

02-2-1081-2009

ATLAS.
Upgrade of the ATLAS Detector and Physics Research at the LHC

Theme leader: V.A. Bednyakov

Participating countries and international organizations:
Armenia, Azerbaijan, Belarus, Bulgaria, Canada, CERN, Czech Republic, France, Georgia, Germany, Israel, Italy, Netherlands, Russia, Slovakia, Spain, USA.

The problem under study and the main purpose of the research:
The main purpose of the international ATLAS experiment is investigation of proton-proton interactions at unprecedented energies at the LHC collider (from 7 to 14 TeV center-of-mass energy), in particular, detailed study of the Standard Model, its application limits, search for answers to the key problems in particle physics and astrophysics, such as the origin of elementary particles masses, nature of the dark matter in the Universe, existence of extra dimensions, are carried out with the ATLAS detector. We participate in software development and in upgrade of the detector's subsystems.

Projects in the theme:

	Name of the project	Project Leaders	Project code
1.	ATLAS. Physical researches at the LHC	V.A. Bednyakov E.V. Khramov	02-2-1081-1-2010/2025
2.	Upgrade of the ATLAS Detector	A.P. Cheplakov	02-1-1081-2-2013/2025

Projects:

	BLTP	A.B. Arbuzov, A.V Bednyakov, S.G. Bondarenko, D.I.Kazakov, O.V. Teryaev	

Brief annotation and scientific rationale:
The main goal of the ATLAS experiment is to study proton-proton interactions at unique LHC energies (7-14 TeV). These interactions are the source of many physical processes (including yet unknown) between elementary particles. Study of these processes and their theoretical description within unified point of view is the general aim of modern physics.
In particular, with the ATLAS detector is already used to scrutinise the current Standard Model of particle physics, investigate the limits of its applicability, and seek answers to the key questions of the present stage of development of physics and astrophysics, such as the nature of dark matter in the Universe, the presence of extra spatial dimensions, etc.

The multi-purpose detector ATLAS (like CMS) operating on the LHC, the most advanced collider in terms of the energy of colliding protons achieved under laboratory conditions, is a unique and unprecedented in its complexity physical device which, on the one hand, accumulates the most advanced achievements of modern science, engineering, technology and communication tools, and on the other hand, guarantees (by virtue of the aforesaid) attaining the main objective of its creation – production of entirely new knowledge about the world around us. Therefore, participation in a such large-scale international project as the ATLAS experiment at the LHC is absolutely necessary for such international organizations as our JINR. This gives access to the state-of-the-art technology and allows us to be involved in production of unique scientific results.

Expected results upon completion of the project:
Absolutely new and unique data will be obtained in multifaceted and comprehensive research of proton-proton scattering processes. The analysis of these data will allow several fundamental physical problems to be solved. Within this Project, JINR scientists will participate in this analysis.
It is expected to obtain new results and make publications on all above-mentioned tasks where JINR scientists have responsibilities. The most important tasks are the studies of the proton structure and hadron state spectrum, probing of the Standard Model at the LHC energies, search for and investigation of supersymmetry, search for the evidence of existence of new particles and new interactions. In addition, JINR intends to obtain new results that will help specify properties of already known elementary particles such as W and Zbosons, top quark, heavy baryons etc.

The implementation of this Project aimed at solving highly significant scientific problems will yield unique applied results which may significantly change the quality of life. Among these results are the experience in operation of remote monitoring systems for technically complicated devices, big data processing and development and practical use of distributed comtputing systems (GRID) and database monitoring applications in long-term large-scale experiments.

Expected results of the project in the current year:
1. Search for the chiral Z */W * bosons in the two-jet decays and in a process with more complex topology of their associative production including heavy b and t quarks.
2. Search for (supersymmetric) charged Higgs bosons via their specific decay modes (3-lepton, etc).
3. Analyses of associated productions of the SM Higgs boson with the top-antitop pair and search for production with a single top.
4. Search for a valence-like nonperturbative component of heavy quarks in the proton (intrinsic heavy quarks) via specific final state topology in the pp interactions.
5. Search for new hadrons and baryons containing heavy c and b quarks and study of their properties.
6. Measurement of the Drell-Yan triple-differential cross section and the effective leptonic weak mixing angle in the Z-boson decay.
7. New comprehensive study of the gluon structure of the proton, etc.
8. Search for quantum black holes in the lepton+jet channel at 13 TeV.
9. Participation in development of the event trigger indexing infrastructure.
10. Development and maintenance of the TDAQ system.
11. Development of database monitoring applications.
12. Participation in the Phase-2 ATLAS Upgrade Project of the muon spectrometer and calorimeters.

2. Upgrade of the ATLAS Detector	**A.P. Cheplakov** (VBLHEP)	Implementation
DLNP	A.P. Gongadze + 5 pers., Yu.N. Davydov + 7 pers.	
VBLHEP	A.P. Cheplakov + 5 pers.	
FLNP	M.V. Bulavin	

Brief annotation and scientific rationale:
The second phase of the ATLAS detector upgrade is aimed at preparing the facility for operation in the conditions of high luminosity of the LHC. During the first phase, which was successfully completed in 2022, the main contribution of the JINR group was participation in the implementation of the project to create a new muon wheel, an important element of the muon spectrometer. The modernization of the muon spectrometer continues in terms of creating RPC cameras. The development, testing and manufacturing of a system for reading signals from a liquid-argon calorimeter (LAr) based on fiber optic technology is underway. With the participation of JINR, a new high-granularity timing detector (HGTD) is being developed.

Expected results upon completion of the project:
Completion of the modernization of the detector systems will ensure stable and efficient operation of the ATLAS facility with the LHC luminosity at a level 5–7 times higher than the design value of about 10^{34} cm^{-2} s^{-1}, and collecting full statistics at the level of 3000 fb^{-1}.

Expected results of the project in the current year:
Development and prototyping of the RPC cameras. Creation of fiber optic cables for the LAr test bench. Creation of a tooling prototype for HGTD assembly.

02-1-1083-2009

CMS. Compact Muon Solenoid at the LHC

Theme leader: V.Yu. Karjavin

Scientific leader: V.A. Matveev

Participating countries and international organizations:
Armenia, Austria, Belarus, Belgium, Brazil, Bulgaria, CERN, China, Croatia, Cyprus, Czech Republic, Estonia, Finland, France, Georgia, Germany, Greece, Hungary, India, Iran, Ireland, Italy, Lithuania, Mexico, Montenegro, Netherlands, New Zealand, Pakistan, Poland, Republic of Korea, Russia, Serbia, Spain, Switzerland, Taiwan, Turkey, United Kingdom, USA, Uzbekistan.

The problem under study and the main purpose of the research:
Development and realization of a research program at the LHC accelerator complex to study phenomena within the standard model and beyond; modernization, commissioning and operation of the CMS experimental complex.

Projects in the theme:

	Name of the project	Project Leader	Project code
1.	CMS	V.Yu. Karjavin	02-1-1083-1-2010/2025
2.	Upgrade of the CMS Detector	V.Yu. Karjavin	02-1-1083-2-2014/2026

Projects:

	Name of the project Laboratory (Subdivision)	Project Leader Responsible from laboratories	Status
1.	**CMS** VBLHEP, MLIT, BLTP, UC	**V.Yu. Karjavin** the list of participants is given in Activities	Realization

Brief annotation and scientific rationale:
The goal of research is to study the physics of pp collisions at the Large Hadron Collider (LHC) using data collected with the CMS detector, corresponding to an integrated luminosity of up to 450 fb^{-1}; data taking, data processing and analysis to obtain new physics results in the following fields:

1. Searches for new physics with the dimuon in final states, based on extended gauge models and scenarios with TeV-scale gravity (extra dimension models).
2. Searches for dark matter candidates with the dimuon/b-quarks in final states and missing transverse energy.
3. Studies of Higgs boson properties and searches for new scalar bosons in lepton decays, predicted by extended Higgs sector.
4. Studies of muon pair production in Drell-Yan process to test SM at new energy scale, measurement of weak mixing angle and parton distribution functions (PDF).
5. Jet measurements for studies of hadronization, improvement of PDF and QCD coupling precision.

The project is also focused on the operation and study of performance of the CMS endcap detectors – hadron calorimeters (Hadron Endcap, HE) and forward muon stations (Muon Endcap, ME1/1).

Expected results upon completion of the project:

1. Experiments with the CMS Detector at the LHC, commissioning and ensuring operation of CMS hadron calorimetry and the forward muon stations during data taking at high luminosity and nominal energy.
2. Development and realization of physics program to test the Standard Model and searches for physics beyond the Standard Model using data collected with the CMS detector facility at the LHC corresponding to an integrated luminosity of 450 fb^{-1} at a nominal center-of-mass energy.

Expected results of the project in the current year:

1. Tests of the Standard Model and searches for new physics with high energy muons and missing transverse energy in the final state based on processing and analysis of proton-proton collision data collected with the CMS detector at the LHC at a center-of-mass energy of up to 13.6 TeV, corresponding to an integrated luminosity of up to 300 fb^{-1}; development and improvement of algorithms for reconstruction of high energy muons and jets.
2. Maintance and operation of the CMS detectors, participation in data taking, data quality monitoring, and shifts.
3. Development of software for GRID-based distributed system for data processing and analysis. Data transmission between the Tier-1/Tier-2 centers of CMS and JINR.

Activities:

VBLHEP	N.V. Gorbunov, A.O. Golunov	
2. Upgrade of the CMS Detector	**V.Yu. Karjavin**	Realization
VBLHEP, MLIT, BLTP, UC	The list of participants is given in Activities	

Brief annotation and scientific rationale:
Starting from 2029 the LHC will be running at luminosity of 7.5×10^{34} $cm^{-2}c^{-1}$ (High Luminosity LHC, HL−LHC) that will allow increasing statistics by more than one order of magnitude ($L_{int} \sim 3000$ fb^{-1}). The LS 3 for the LHC upgrade to HL−LHC is planned from 2026 to 2029. The main goal of the CMS upgrade in LS3 is to ensure effective work of all subsystems in HL−LHC era.

The main goal of this project is contribution to construction of the Highly Granularity Calorimeter (HGCal) and an upgrade of the CMS ME1/1 Cathode Strip Chambers.

Expected results upon completion of the project:
1. Upgrade of the CMS Detectors with JINR responsibilities to ensure effective operation at high luminosity in pp−collisions at the nominal LHC energy.

Expected results of the project in the current year:
1. Upgrade of the forward muon station ME1/1 and participation in gas chambers ageing study and the new gas mixture studies for endcap CSC.
2. Construction of the experimental facility for complex tests of HGCal active elements.
3. Development of the technology for manufacturing the HGCal cooling plates.

Activities:

02-2-1085-2009

Experimental Tests of the Fundamentals of QCD

Theme leader: A.V. Guskov

Deputy: A.S. Zhemchugov

Participating countries and international organizations:
Belarus, CERN, China, Czech Republic, Germany, Israel, Italy, Japan, Poland, Portugal, Russia, United Kingdom, USA.

The problem under study and the main purpose of the research:
Quantum chromodynamics is a true theory of strong interaction. However, despite its considerable success in describing the interaction of quarks and gluons within the perturbative approach, the question of why hadrons and nuclei are as we see them remains open. Description of fundamental properties of hadrons, such as their masses, spins, parton distributions, form factors, spectra, etc., on the basis of basic principles of QCD is one of the main unsolved problems of quantum chromodynamics. Confinement of quarks and gluons in hadrons, as well as the growth of the running constant of strong interaction with decreasing characteristic scale of interaction energy does not allow direct use of the perturbative approach, which has proved itself at high energies. At present, various phenomenological models are used to quantitatively describe the hadron spectrum, their static properties, and their interactions at low energies. Certain success has been achieved in lattice calculations. A comparison of model predictions and theoretical calculations for observables with measurement results is an important test of the consistency and applicability limits of the approaches used. The ultimate goal of research in this direction, both theoretical and experimental, is to obtain a description of the spectra, structure, and properties of hadrons from first principles of QCD.

Projects in the theme:

	Name of project	Project Leaders	Project code
1.	BESIII	I.I. Denisenko *Deputy:* A.S. Zhemchugov	02-2-1085-1-2007/2028
2.	Study of the fundamental properties of hadrons in the NA66/AMBER experiment	A.V. Guskov	02-2-1085-2-2024/2026

Projects:

	Name of the project	Project Leaders	Status
	Laboratory (Subdivision)	Responsible from laboratories	
1.	**BESIII**	**I.I. Denisenko** *Deputy:* **A.S. Zhemchugov**	Implementation
	DLNP	O.V. Bakina, I.R. Boyko, D.V. Dedovich, P.A. Egorov, A.V. Guskov, Y.A. Nefedov, G.A. Shelkov	
	BLTP	V.V. Bytyev	
	MLIT	G.A. Ososkov, I.S. Pelevanyak, V.V. Korenkov	

Brief annotation and scientific rationale:
The goals of the JINR group in the BESIII project are to study hadronic QCD spectra and search for exotic states, study the production and decays of Charmonium states, search for exotic Charmonium states and charmonium-like structures, and determine c-quark fragmentation functions. The JINR group's participation in the project consists of data analysis and development of algorithms for event reconstruction in the BESIII detector using machine learning methods.

Expected results upon completion of the project:
The project will produce new knowledge about the properties of strong interactions on the $Q^2 \sim M^2_{Jpsi}$ scale. In particular, information will be obtained on the spectrum of exotic light and charmonium-like states and their properties, as well as on the details of inclusive c-quark production.

Expected results of the project in the current year:

1. BESIII data analysis.
2. Development of offline software and analysis tools.
3. Participation in the data taking.

2. Study of the fundamental properties of hadrons in the NA66/AMBER experiment — **A.V. Guskov** — Implementation

DLNP	V.M. Abazov, G.D. Alexeev, N.V. Anfimov, I.I. Denisenko, V.N. Frolov, A. Gongadze, A.O. Gridin, N.A. Koviazina, A. Maltsev, A.A. Piskun, A.G. Samartsev, A.S. Selyunin, S.S. Seryubin, V.V. Tokmenin, A.V. Vtyurin, N.I. Zhuravlev
VBLHEP	V.A. Anosov, O.P. Gavrischuk, R. Gushterski, A.Yu. Korzenev, O.M. Kuznetsov, D.V. Peshekhonov, A.A. Shunko, E.V. Zemlyanichkina
MLIT	A.Sh. Petrosyan

Brief annotation and scientific rationale:

AMBER (Apparatus for Meson and Baryon Experimental Research) is a new experimental facility with a fixed target on the M2 beam line of the CERN SPS. The facility is designed to perform a variety of measurements aimed at addressing fundamental questions of quantum chromodynamics, which are expected to lead to a significant improvement in the understanding of QCD as a modern theory of strong interactions. The proposed measurements cover physics ranging from the smallest Q^2 values, such as determining the charge radius of a proton in elastic muon-proton scattering, reactions with mean Q^2 values for hadronic spectroscopy, and z studies of hadronic structure with high Q^2 using rigid Drell-Yan, Charmonium, and fast photon production processes. The JINR group is responsible for the modernization and operation of the HCAL1 hadron calorimeter and the MW1 (Muon Wall 1) high-angle muon identification system. It is also involved, along with a group from the University of Turin, in the production and support of the Bulk Micromegas track detectors that will replace the obsolete multi-wire chambers (MWPCs) in the SAS behind the SM2 magnet.

Expected results upon completion of the project:

Solving the proton radius puzzle. New knowledge of the quark and gluon structure of mesons. Accurate knowledge of the yield of antiprotons in p-p and p-He processes, essential for the search for dark matter in astrophysical experiments.

Expected results of the project in the current year:

1. Participation in the data taking for the Proton Radius Measurement program.
2. Participation in R&D for Micromegas detectors.
3. Preparation of the front-end electronics upgrade to be able to operate in the triggerless mode.

02-1-1087-2009

Research on Relativistic Heavy and Light Ion Physics. Experiments at the Accelerator Complex Nuclotron-M/NICA at JINR and CERN SPS

Theme leader: A.I. Malakhov

Deputy: S.V. Afanasiev

Participating countries and international organizations:
Armenia, Bulgaria, CERN, China, India, Mongolia, Romania, Russia, Slovakia, USA, Uzbekistan.

The problem under study and the main purpose of the research:
Study of new phenomena in multiple particle productions associated with the manifestation of the quark and gluon degrees of freedom in the interaction of relativistic nuclei. Study of nucleon and nuclear interactions at the VBLHEP accelerator complex, CERN SPS. Energy scan of interactions of nuclei at 20-158 GeV/nucleon energies and the study of their dependence on the atomic number of nuclei. To search for the critical point on the phase diagram of nuclear matter at the NA61/SHINE (SPS, CERN). Study of hadron production in hadron-nucleus interactions. Use of the obtained data for the precision calculations of neutrino spectra and fluxes in the accelerator experiments to study the neutrino oscillations. Investigation of nucleon clustering and the contribution of unstable nuclear-molecular States to the dissociation of light stable and radioactive isotopes, as well as the properties of rarefied baryonic matter in the dissociation of heavy nuclei. Experimental and theoretical study of deep subthreshold, cumulative processes, the formation of hadrons and antimatter in the transition energy region. Investigation of processes in the region of large P_T ($P_T \geq 1$ GeV/c) in non-cumulative and cumulative kinematic regions at SPIN and FODS setups. Study of the behavior of elementary particles, nucleon resonances and nucleon fluctuations in nuclear matter on the SCAN spectrometer. Preparation of proposals of the experiments at the VBLHEP accelerator complex on the Nuclotron extracted beams and NICA Collider. Study of the short-range nucleon-nucleon correlations and the cluster structure of the nuclei using the beams of ions, polarized protons and deuterons at the internal target of the Nuclotron.

Project in the theme:

	Name of the project	Project Leaders	Project code
1.	NA61/SHINE	A.I. Malakhov *Deputies:* A.V. Dmitriev A.A. Zajtsev	02-1-1087-1-2012/2024

Project:

	Name of the project Laboratory (Subdivision)	Project Leaders Responsible from laboratories	Status
1.	**NA61/SHINE**	**A.I. Malakhov** *Deputies:* **A.V. Dmitriev** **A.A. Zajtsev**	Upgrade Preparation Data analysis
	VBLHEP	V.A. Babkin, M.G.Buryakov, V.M. Golovatyuk, V.A. Kireev, R.Yu. Kolesnikov, V.A. Matveev, G.L. Melkumov, M.M. Rumyantsev	
	DLNP	G.I. Lykasov, V.V. Lyubushkin, B.A. Popov, V.V. Tereschenko	

Brief annotation and scientific rationale:
The main physics goals include: search for the second-order critical end-point in the temperature versus baryon-chemical potential phase diagram (looking for nonmonotonic behavior of critical point signatures, such as transverse momentum and multiplicity fluctuations, intermittency signal, etc., when system freezes out close to the critical point), study the properties of the onset of deconfinement (search for the onset of the horn, kink, step, and dale structures in collisions of light nuclei). In recent years, the program has been extended by Pb+Pb collisions where the open charm production, as well as collective effects are studied. Based on the obtained results, few years ago NA61/SHINE introduced a concept of two onsets in nucleus-nucleus collisions at the CERN SPS energies: onset of deconfinement (beginning of QGP formation – collision energy threshold for deconfinement) and onset of fireball (beginning of formation of a large cluster which decays statistically – system-size threshold for creation of statistical

system). The strong interactions program is based on beam momentum scans (13A-158A·GeV/c) with light and intermediate mass nuclei (from p+p to Xe+La).

Expected results upon completion of the project:
Data analysis of the NA61/SHINE experiment (SPS, CERN). Studies of the birth of hadrons in hadron-nuclear interactions. The study of the formation of charmed hadrons (mainly D-mesons) during the interaction of heavy ions in order to obtain new data on the average number of charmed quark-antiquark pairs and to understand the mechanism of the birth of open charm. Obtaining data for precision calculation of neutrino spectra and fluxes in accelerator experiments for the study of neutrino oscillations. Completion of the modernization of the TOF system.

Expected results of the project in the current year:
Processing and analysis of experimental data obtained at the NA61/SHINE installation on p+p, Be+Be, Ar+Sc, O+O, Pb+Pb collisions. Conducting experimental studies on a beam of relativistic lead nuclei. Investigation of anti-core formation in Ar+Ca and Xe+La collisions. The study of the formation of enchanted hadrons in the interaction of heavy ions in order to understand the mechanism of the birth of an open charm.

Activities:

Name of the activity	**Leaders**	**Status**
Laboratory (Subdivision)	Responsible from laboratories	
1. Experiment BECQUEREL2023	**P.I. Zarubin**	Data taking Data analysis
VBLHEP	D.A. Artemenkov, V. Bradnova, N.K. Kornegrutsa, M. Natarjan, P.A. Rukoyatkin, V.V. Rusakova, A.A. Zaytsev	

Expected results upon completion of the activity:
Search and study of the Hoyle state and more complex nuclear-molecular States in the dissociation of light nuclei. Analysis of the isotopic composition of the fragmentation of heavy nuclei. Use of automated microscopes, as well as improvement of the NE technology.

Expected results in the current year of the activity:
Analysis of exposures to Xe (NICA/Nuclotron) and Kr (GSI) nuclei to study ^{8}Be decays and the Hoyle state and accompanying α-ensembles and search for the 4α-condensate. Estimation of the parameters of accompanying neutrons. Mastering identification by multiple scattering of *He* and *H* isotopes on a motorized microscope. Search for ^{8}Be and ^{9}B isobar-analogue states in the ^{9}Be and ^{10}C exposures. Mastering the identification of ensembles of stopped α-particles in the fragmentation of nuclei from the composition of the emulsion under the action of relativistic particles.

2. Experiment FASA-3 for registration of nuclear fragments	**S.P. Avdeev**	Upgrade Preparation Data analysis
DLNP	V.I. Stegaylov	
FLNR	V.V. Kirakosyan, E.M. Kozulin, G.V. Mushinsky, O.V. Strekalovsky	
VBLHEP	H.U. Abraamian, Z.A. Igamkulov, V. Karach, L.V. Kornyushina, P.A. Rukoyatkin, Z.A. Sadygov	

Expected results upon completion of the activity:
Analysis of the experimental data on the processes of the multiple emission of intermediate mass fragments on the beams of relativistic light ions using a 4-π PHASE-3 setup for the registration of nuclear fragments. Performing data analysis to determine the mechanism of multifragmentation and to obtain new information about the nuclear phase transitions “liquid-fog” and “liquid-gas”. Investigation of properties of hot nuclei formed in the collisions of light relativistic ions with heavy targets. Production of the detector system for the registration of the decay of hypernuclei.

Expected results in the current year of the activity:
Debugging of the QUARTUS CAEN program at the PHASE spectrometer for registration of nuclear fragments. Analysis of experimental data in the framework of statistical and dynamic models. Preparation of a new project.

3. SCAN-3

S.V. Afanasiev
D.K. Dryablov

Preparation
Data analysis
Upgrade

VBLHEP	Yu.S. Anisimov, A.A. Baldin, B.V. Dubinchik, P.R. Kharyuzov, S.V. Kilchakovskaia, Yu.F. Krechetov, M. Paraypan, D.G. Sakulin, V.A. Smirnov, E.V. Sukhov, V.V Ustinov, V. Vartik

Expected results upon completion of the activity:
Upgrade of the SCAN setup. Analysis of the experimental data on the behavior of nucleon resonances and nucleon fluctuations in nuclei, on the search and study of properties of the bound state-meson in nuclear matter.

Expected results in the current year of the activity:
Testing of a three-beam magnetic spectrometer SCAN. Conducting a technical session on the internal beam of the nuclotron to adjust the detectors and debug the data collection program. Analysis of experimental data.

4. Acquisition, processing and digitation of information from bubble chamber and other fixed target experiments in the conditions of registration of multiple particle production in an energy range of 1-300 GeV

A.A. Baldin
V.V. Glagolev

Data analysis

VBLHEP	S.G. Arakelyan, E.G. Baldina, A.V. Belyaev, A.V. Beloborodov, Ver.V. Bleko, Vit. V. Bleko, D.N. Bogoslovsky, S.A. Chetverikov, A.P. Ierusalimov, V.V. Ilyushchenko, P.R. Kharyuzov, E.A. Klevcov, D.S. Korovkin, N.E. Kukharev, V.A., Pukhaeva, O.V. Rogachevsky, A.B. Safonov, A.Yu. Troyan, Yu.A. Troyan

Expected results at the end of the topic or project stages:
Collection, processing and digitization of the film information obtained using bubble chambers and in electronic experiments with fixed targets under the conditions of registration of multiple birth of particles in the energy range of 1-300 GeV.
Preparation of an education programme for highly qualified students for the NICA project.

Expected results in the current year of the activity:
Analysis of bubble chamber data, search and research of new phenomena based on the JINR LIT supercomputer. Replenishment of the experimental data base in the field of relativistic nuclear physics.
Refinement of the results obtained on a propane two-meter chamber, and analysis of data on the results of the NA61/SHINE experiment.

5. Investigation of deep subthreshold processes, applied and educdtional programs at MARUSYA set up

A.A. Baldin

Preparation
Data taking

VBLHEP	S.V. Afanasiev, V.A. Arefiev, E.G. Baldina, S.N. Bazylev, A.V. Belyaev, A.I. Berlev, A.V.Beloborodov, Ver.V. Bleko, Vit. V. Bleko, D.N. Bogoslavsky, S.A. Chetverikov, D.K. Dryablov, E.A. Efimova, P.R. Kharyuzov, E.A. Klevcov, D.S. Korovkin, C.B. Kukharev, A.B. Safonov, V.A. Semashko, S.S. Shimansky, I.V. Slepnev, S.Yu. Starikova, A.Yu. Troyan, Yu.A. Troyan
BLTP	S.G. Bondarenko
MLIT	V.V. Korenkov
DLNP	A.N. Fedorov

Expected results upon completion of the activity:
Updating the Marusya installation for conducting the experimental studies with the extracted Nuclotron beams. Investigation of A-dependences of rare subthreshold and cumulative processes of the formation of pions, kaons and antiprotons depending on the type and energy of the incoming nuclei, the momentum and angle of the detected particles. Carrying out correlation experiments with registration of groups of particles in the final state, one of which is cumulative.

Expected results in the current year of the activity:
Reconstruction of the experimental zone of the channel spectrometer in focus F4. Creation of a new installation data collection system. Commissioning of track detectors. Development and creation of a neutron detector. Testing of the Cherenkov detector.

6.	**Investigation with light and heavy ions for applied research**	**A.I. Malakhov**	Realization Preparation Data taking
	VBLHEP	N.N. Agapov, Yu.S. Anisimov, A.A. Baldin, E.G. Baldina, D.K. Dryablov, M. Paraypan	

Expected results upon completion of the activity:
Use of heavy and light ions for applied research.

7.	**Upgrade of equipment the station of internal target of the Nuclotron**	**S.V. Afanasiev** **R.Yu.Kolesnikov**	Upgrade Data taking
	VBLHEP	Yu.S. Anisimov, V.N. Bekirov, D.K. Dryablov, B.V. Dubinchik, S.V. Kilchakovskaia, S.N. Kuznetsov, D.G. Sakulin, T.V. Trofimov	

Expected results upon completion of the activity:
Replacement of target operation control electronics from the KAMAK system to modern industrial standards. Creating software for new electronics. Production of a target based on the carbon isotope ^{13}C.

Expected results in the current year of the activity:
Preparing the station for operation in the spring Nuclotron Run.

8.	**Test of the detectors for measurements and control the luminosity at the collider NICA**	**G.D. Milnov**	R&D Technical Proposal
	VBLHEP	K.U. Abraamyan, R.A. Akberov, T.Y. Bokova, Z.A. Igamkulov, L.V. Kornyushina, I.I. Migulina, A.Z. Sadygov, Z.Y. Sadygov, V.I. Shokin	
	FLNP	E.I. Litvinenko	

Expected results upon completion of the activity:
Creation of a detector and development of algorithms for configuring beam reduction in the NICA collider.

Expected results in the current year of the activity:
Preparation of a technical project for luminosity measurement at the NICA collider.

Production of two planes for the luminosity measurement detector.

9.	**Study of the short range nucleon-nucleon correlations at modernized internal target station at Nuclotron**	**V.P. Ladygin**	Preparation Data taking
	VBLHEP	Yu.V. Gurchin, A.Yu. Isupov, N.B. Ladygina, A.I. Malakhov, S.G. Reznikov, A.A. Terekhin, A.V. Tishevsky	

Expected results upon completion of the activity:
Preparation of a project to study spin asymmetries at the LHEP accelerator complex.

Expected results in the current year of the activity:
Processing of experimental data obtained on a ^{124}Xe beam with an energy of 3 GeV/nucleon.

10. Search and investigation of a new charged particle in the 2-120 MeV mass range

V.A. Nikitin

Data analysis

VBLHEP

M.Kh. Anikina, A.V. Beloborodov, V.S. Rikhvitsky, A.Yu. Troyan, A.A. Zaicev

Expected results upon completion of the activity:
Search and investigation of a charged particle in the 2-120 MeV mass range.

Expected results in the current year of the activity:
Addition of existing results with new data.

11. Fundamental and applied research with relativistic electron beams in the framework of FLAP collaboration

A.A. Baldin

Development and testing of diagnostic systems
Data acquisition and analysis

VBLHEP

A.V. Beloborodov, Ver.V. Bleko, Vit.V. Bleko, D.N. Bogoslovskiy, D.S. Korovkin, A.B. Safonov, S.A. Chetverikov, P.R. Khar'yuzov, E.G. Baldina, E.A. Klevtsova, V.A. Kukharev, V.V. Kobets, M.A. Nozdrin, Yu.A. Troyan

Expected results upon completion of the activity:
Development of secondary particle detectors for collider experiments.

Study of mechanisms of electromagnetic interactions and regularities of generation of electromagnetic radiations, including controllable generation of THz radiation.

Development of a test bench for registration of neutron spectra with time of flight energy measurement system.

Expected results in the current year of the activity:
Development and beam tests of particle detectors based on fast scintillators.

Registration of GHz radiation from active targets irradiated by relativistic electron beams.

Development of a test bench for registration of secondary neutrons.

ALICE.
Study of Interactions of Heavy Ion and Proton Beams at the LHC

Theme leader: A.S. Vodopyanov

Participating countries and international organizations:
Armenia, Austria, Azerbaijan, Bangladesh, Brazil, Bulgaria, CERN, China, Croatia, Cuba, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, India, Indonesia, Italy, Japan, Malta, Mexico, Netherlands, Norway, Pakistan, Peru, Poland, Republic of Korea, Romania, Russia, Slovakia, South Africa, Sri Lanka, Sweden, Thailand, Turkey, Ukraine, United Kingdom, USA.

The problem under study and the main purpose of the research:
Experimental study of heavy ion interactions at relativistic and ultra-relativistic energies.

Project of the theme:

	Name of the project	Project Leader	Project code
1.	ALICE	A.S. Vodopyanov	02-1-1088-1-2010/2025

Project and activities:

	Name	Leader	Status
	Laboratory (Subdivision)	Responsible from laboratories	
1.1.	**ALICE. Particle detectors**	**A.S. Vodopyanov**	Realization
	VBLHEP	V.I. Astakhov, V.A. Arefiev, S.C. Ceballos, R.A. Diaz, V.H. Dodokhov, E.M. Klass, V.I. Lobanov, P.V. Nomokonov, I.A. Rufanov	

Brief annotation and scientific rationale:
Participation in the preparation of proposals for the modernization of the ALICE detector: a superconducting magnet, an external tracker based on silicon sensors.

Expected results upon completion of the project:
Participation in the maintenance and operation of the ALICE detector. Participation in the preparation of the modernization of the ALICE detector: a superconducting magnet, an outer tracker based on silicon sensors.

Expected results of the project in the current year:
Participation in the maintenance and operation of the ALICE detector. Elaboration of the technical project of an electromagnetic calorimeter and an outer tracker.

1.2.	**Physical process simulation and data analysis**	**B.V. Batyunya**	Realization
	VBLHEP	M.Yu. Barabanov, S.S. Grigoryan, A.V. Kuznetsov, L.V. Malinina, K.P. Mikhaylov, V.N. Pozdnyakov, E.P. Rogochaya, Yu.L. Vertogradova	
	DLNP	G.I. Lykasov	
	BLTP	D. Blaschke, S.N. Nedelko	

Brief annotation and scientific rationale:
Participation in the development of the ALICE scientific program and the processing and analysis of experimental data.

Expected results upon completion of the project:
Processing and analysis of experimental data on femtoscopy of charged kaons and ultraperipheral interactions in collisions of protons, nuclei and nuclei with protons. Preparation of publications, reports at international conferences.

Expected results of the project in the current year:
Processing and analysis of experimental data on femtoscopy of charged kaons and ultraperipheral interactions in collisions of protons, nuclei and nuclei with protons. Preparation of publications, reports at international conferences.

1.3. ALICE. Computing in the distributed environment-GRID	**A.S. Vodopyanov**	Realization
VBLHEP	B.V. Batyunya, E.P. Rogochaya, G.G. Stiforov	
MLIT	A.O. Kondratiev, V.V. Mitsyn	

Brief annotation and scientific rationale:
Processing and analysis of experimental data are carried out within the framework of the distributed computer network GRID of the ALICE collaboration. Modernization of equipment and software is carried out on a permanent basis. The LIT JINR Complex is part of the ALICE GRID.

Expected results upon completion of the project:
Maintaining the working state of the ALICE GRID part at JINR.

Expected results of the project in the current year:
Maintaining the working state of the ALICE GRID part at JINR.

1.4. Photon Spectrometer PHOS	**A.S. Vodopyanov** **P.V. Nomokonov**	Realization
VBLHEP	M. Buryakov, A. Burdyko, S. Buzin, N.V. Gorbunov, A.V. Kuznetsov, S.A. Rufanov	

Brief annotation and scientific rationale:
In connection with the need to radically improve the time resolution of the PHOS electromagnetic calorimeter, work is underway to develop a new system for reading signals from lead tungstate crystals.

Expected results upon completion of the project:
A new system for reading signals from lead tungstate crystals based on silicon photomultipliers and new recording electronics is proposed.

Expected results of the project in the current year:
Development of new registration electronics, testing of prototypes on PS and SPS CERN beams.

1.5. Superconducting magnet	**A.S. Vodopyanov**	Project
VBLHEP	N.A. Baldin,V.Kh. Dodokhov, V.I. Lobanov, Yu.Yu. Lobanov, I.A. Oleks	

Brief annotation and scientific rationale:
As part of the modernization of the ALICE detector (PHASE2), it is planned to create a superconducting magnet.

Expected results upon completion of the project:
Participation in the design and creation of a superconducting magnet.

Expected results of the project in the current year:
Elaboration of the stages of manufacturing a superconducting cable.

02-1-1096-2010

Study of Rare Charged Kaon Decays and Search for Dark Sector in Experiments at the CERN SPS

Theme leader: V.D. Kekelidze

Deputies: D.V. Peshekhonov
D.T. Madigozhin

Participating countries and international organizations:
Belarus, Belgium, Bulgaria, Canada, CERN, Chile, Czech Republic, France, Germany, Italy, Kazakhstan, Mexico, Romania, Russia, Slovakia, Switzerland, United Kingdom, USA.

The problem under study and the main purpose of the research:
Search for and study of rare kaon decays and CP violation processes. Search for rare events using beam-dump and missing energy techniques with CERN SPS secondary beams. Search for phenomena beyond the Standard Model. Construction and maintenance of detectors.

Projects in the theme:

	Name of the project	Project Leaders	Project code
1	NA62	V.D. Kekelidze *Deputy:* D.T. Madigozhin	02-1-1096-1-2010/2024
2.	NA64	V.A. Matveev D.V. Peshekhonov	02-1-1096-2-2017/2026

Projects:

	Name of the project Laboratory (Subdivision)	Project Leaders Responsible from laboratories	Status
1.	**NA62**	**V.D. Kekelidze** *Deputy:* **D.T. Madigozhin**	Data taking Data analysis
	VBLHEP	A.N. Baeva, D. Baigarashev, V.V. Bautin, A.A. Belkova, D.D. Emelyanov, T.L. Enik, V.P. Falaleev, S.R. Gevorgyan, V.N. Gorbunova, E.A. Gudzovsky, I. Kambar, D. Kereibay, A.M. Korotkova, M. Misheva, N.A. Molokanova, I.A. Polenkevich, K.M. Salamatin, S.N. Shkarovsky	

Brief annotation and scientific rationale:
Realization of the NA62 Project allows to clarify the CP-violation problem, to measure precisely very rare charged kaon decay to charged pions and two neutrinos, to carry out a search for supersymmetric particles and their partners to observe physics beyond the Standard Model. In addition, the characteristics of rare kaon and hyperon decays will be improved. Straw-detectors of the NA62 high resolution magnetic spectrometer working in vacuum will be supported during experimental runs. Development of a new detector prototype based on straws with a smaller diameter will be started to use it at higher intensity of the beams. Software for simulation, data analysis and processing will be developed.

Expected results upon completion of the project:
Measurement of the rare decay of a charged kaon into a pion and two neutrinos with an accuracy of about 10%, which will make it possible to refine the parameters of the Cabibbo-Kobayashi-Maskawa matrix and will be a decisive test of the Standard Model. In addition, the probabilities and other parameters of a number of rare decays of charged kaons will be measured, which will make it possible to refine the parameters of the Chiral Perturbation Theory, which describes strong interactions at low energies.

Expected results of the project in the current year:
1. NA62 and NA48/2 data analysis will be carried out. Two articles will be published in peer-reviewed journals with decisive participation of JINR staff in data analysis.

2. Software for the simulation of the magnetic spectrometer and full set-up will be developed; system for detector calibration and event reconstruction will be upgraded; general software of the experiment will be developed.

3. Participation in the maintenance of the NA62 spectrometer, as well as in the development and maintenance of the control system for all detectors of the experiment.

4. Participation in the development of a straw detector for high intensity beams.

5. Participation in the NA62 experimental run at the CERN SPS.

2. NA64 **V.A. Matveev**
D.V. Peshekhonov

Preparation

DLNP	V.N. Frolov
BLTP	A.S. Zhevlakov

Brief annotation and scientific rationale:
The main objective of the NA64 experiment is to search for new physics beyond the SM, namely the search for the dark photon (A'), hypotetical boson with 16.7 MeV mass and other manifestations of the dark sector in the experiments on the CERN SPS electron and muon secondary beams. Tracking detectores based on the straw tube technology support. Software for data MC simulation and analysis will be developed. Data analysis will be provided.

Expected results upon completion of the project:
The main aim of the NA64 project is s search of the new physics beyond the SM, namely the search on the secondary CERN SPS electron and muon beams of the dark photon (A') and hypotetical 16,7 GeV boson as well as other dark sector manifestations.

Expected results of the project in the current year:
1. NA64, analysis of the experimental data.

2. Operation and support of the detectors.

3. Participation in NA64 experimental runs in the experimental zone on the H4 and muon SPS channels, CERN.

4. On-line and off-line software development, for the straw chambers analysis and for the DAQ experiment in particular.

Strangeness in Hadronic Matter and Study of Inelastic Reactions Near Kinematical Borders

Theme leaders: E.A. Strokovsky
E.S. Kokoulina
D.O. Krivenkov

Participating countries and international organizations:
Belarus, Czech Republic, Japan, Russia, Slovakia, Ukraine.

The problem under study and the main purpose of the research:
Strangeness in hadronic matter and study of boundary effects:

1. Study of stabilizing effects of strangeness in nuclear matter and properties of the lightest hypernuclei.
2. Study of multi-particle dynamics in the inelastic proton-proton and proton-nucleus interactions with extremally high multiplicity.
3. Study of spectra and yields of soft photons in the deuteron-nucleus and nucleus-nucleus interactions.
4. Determination of hadronization parameters at NICA energy at the SPD facility.
5. Study of Short-Range Correlated (SRC) pairs of nucleons.

Activities:

	Name of the activity	**Leaders**	**Status**
	Laboratory (Subdivision)	Responsible from laboratories	
1.	**Experiment NIS-GIBS**	**E.A. Strokovsky** **J. Lukstins** **D.O. Krivenkov**	Realization Data taking
	VBLHEP	V.D. Aksinenko, M.H. Anikina, K.V. Asadova, T. Atovullaev, A. Atovullaeva, A.V. Averyanov, S.N. Bazylev, A.E. Baskakov, D.V. Dementiev, A.A. Feschenko, A.A. Fedyunin, A.I. Filippov, S.V. Gertsenberger, A.S. Khvorostukhin, A.M. Korotkova, Yu.A. Murin, S. Nepochatykh, O.V. Okhrimenko, S.N. Plyashkevich, N.G. Parfenova, M. Patsyuk, P.A. Rukoyatkin, A.V. Salamatin, A.V. Shipunov, M.O. Shitenkov, A.D. Sheremetiev, I.V. Slepnev, V.M. Slepnev, N.A. Tarasov, A.V. Terleskiy, A.L. Voronin	
	DLNP	B.A. Popov, V.V. Tereschenko, S.V. Tereschenko	
	OCE	A.N. Parfenov	

Brief annotation and scientific rationale:
The study of properties of the lightest hypernuclei is actual, has high significance and the Nuclotron beam is suitable place to investigate these tasks. The study of properties of light neutron-rich hypernuclei is of great interest, first of all, to clarify the theory of the intranuclear nucleon-nucleon interactions: the neutron halo, ΛN interaction including ΛN – ΣN conversion and the spin-dependent ΛN interaction etc. The special interest to this investigation is because of absence of reliable data on ${}^{6}_{\Lambda}$H properties and theoretical predictions that are strongly depend on model and controversial. Simultaneously, the lifetimes and production cross sections of ${}^{4}_{\Lambda}$H and ${}^{3}_{\Lambda}$H will be studied in the same experiment. The and measurement scan be used as "reference points" to confirm the production and decay of ${}^{6}_{\Lambda}$H**.**

Expected results upon completion of the activity:

1. Experimental conclusion about the existence of the hypernucleus ${}^{6}_{\Lambda}$H.
2. New experimental data on the properties of the lightest hypernuclei and experimental verification of corresponding theoretical models for these hypernuclei.

3. New experimental data on the drip-line location for loosely bound light hypernuclei with high neutron excess, necessary for the development of the theory of neutron-rich hypernuclei and models of their production in non-central nucleus-nucleus interactions.

4. New experimental data on the production of strangeness and vector mesons (including those, containing strange quarks) by polarized photons (close to the relevant thresholds).

Expected results of the activity in the current year:

1. Data taking for $^{6}_{\Lambda}$H search using beam of ^{7}Li nuclei. Analysis of the first experimental data for the $^{6}_{\Lambda}$H search and for the measurements of hyperhydrogen isotopes $^{6}_{\Lambda}$H and $^{4}_{\Lambda}$H lifetimes.

2. Upgrade of the HyperNIS magnetic spectrometer (tracking system) by adding the planes of GEM detectors. These detectors, which have already been (partially) purchased and are being tested at the HyperNIS setup by staff, will be integrated into this setup to improve accuracy of the hypernucleus decay vertex determination. Preparation of a project for joint experiments with SRC, integration of detectors, development of a technical design for a spectrometer with two magnets (installations of a second magnet, supply of communications, supports for detectors), common data acquisition systems (design and tests), MC for the optimal geometry of joint detectors.

3. Within the collaboration with Japan: data taking at LEPS/LEPS2 setups on the production of strangeness and vector mesons (including those, containing strange quarks) by polarized photons (close to the relevant thresholds); analysis of data on such reactions, taken before.

4. Preparing the new combined HyperNIS and SRC project.

2. SRC — **M. Patsyuk** — Realization, Data taking

VBLHEP: V.D. Aksinenko, M.H. Anikina, T. Atovullaev, A. Atovullaeva, A.V. Averyanov, A.A. Feschenko, S.V. Gertsenberger, A.M. Korotkova, S. Nepochatykh, O.V. Okhrimenko, N.G. Parfenova, S.N. Plyashkevich, P.A. Rukoyatkin, A.V. Salamatin

DLNP: V.V. Tereschenko

Brief annotation and scientific rationale:

The properties of nuclei are defined by interaction of their constituents: nucleons on the level of lower resolution and quarks and gluons at high resolution. The relation between these two descriptions remains a challenge. Short-Range Correlated (SRC) pairs of nucleons, which are temporary fluctuations of strongly interacting nucleons at a distance of around nucleon radius and individual momenta larger than that of mean-field nucleons, are coupled to both nuclear scales. Electron scattering experiments have shown the far-reaching impacts SRCs have on the many-body systems, the nucleon-nucleon interaction, and nucleon substructure.

Expected results upon completion of the activity:

The emphasis for the next SRC experiment planned at the new HyperNIS location will be refined based on the analysis results. The main idea of this proposal is to show that the SRC setup can fit into the HyperNIS setup with minimal distraction. However, a larger band by the magnetic field is needed to obtain the required resolution. For that a second magnet needs to be installed. Another solution is creating a new analyzing magnet instead of the installed one.

Expected results of the activity in the current year:

1. SRC at BM@N data analysis.

2. Estimation of the momentum resolution of the HyperNIS magnetic spectrometer in the perspective of solving the problems of the SRC experiment.

3. Estimation of the momentum resolution of the HyperNIS magnetic spectrometer for solving tasks of the SRC experiment.

4. Preparing the new combined HyperNIS and SRC project instead of activity.

3. NEMAN — **E.S. Kokoulina**, **V.A. Nikitin** — Project preparation, Data taking

VBLHEP: V.P. Balandin, N. Barlykov, Yu.T. Borzunov, V.B. Dunin, V. Dudin, O.P. Gavrischuk, V.Yu. Ivanenko, D.A. Kirillov, A.V. Konstantinov, R.I. Kukushkina, V.V. Popov, I.A. Rufanov, S.Yu. Sinelcshikova, M.V. Tokarev, V.A. Zykunov

BLTP: Yu.A. Bystritsky

Brief annotation and scientific rationale:
In high energy physics, events are usually analyzed for which the deviation from the average multiplicity does not exceed two average values. Events with a higher multiplicity occur extremely rarely, so it is difficult to collect large statistics for them, in addition, there are difficulties in processing them. When planning any experiment, simulations are performed, but despite the fact that the number of Monte Carlo generators increases every year, their predictions deviate significantly in the region of high multiplicity. Setting their parameters at the given energy stops working when moving to a higher energy. All this indicates a significant misunderstanding of the mechanism of multiple production. The study of events with the production of a large number of secondary particles will allow a deeper understanding of strong interactions, including the hadronization stage. In the region of high multiplicity, a series of collective phenomena with a quantum nature are predicted, such as the formation of a pion (Bose-Einstein) condensate, an excess soft photon (less than 50 MeV) yield, Cherenkov radiation of gluons by quarks, and others. In this region, the longitudinal component of the momentum approaches the transverse component, reaching it. This indicates the disappearance of the leading effect, and in the same region, apparently, the formation of a condensate begins. These and other collective manifestations in the behavior of secondary particles can be studied at the future NICA collider in the SPD project, since it is planned to register events in the absence of any trigger. This project is aimed at studying the gluon component of the nucleon. The study of processes with high multiplicity in the model of gluon dominance developed at JINR will provide additional knowledge about the gluon component of the nucleon and its contribution to hadronization.

Expected results upon completion of the activity:
1. Preparation of a physics program for the study of collective phenomena in the region of high multiplicity in proton and deuterium interactions at the SPD facility at the NICA collider.
2. Development of the gluon dominance model for the collective behavior study of secondary particles in high multiplicity events at the energies of the future NICA collider at the SPD facility. Estimates of the contribution of gluon bremsstrahlung by quarks and gluon fission as dominant elementary QCD processes in this region. Estimatesof hadronization parameters for different kinds of hadrons.
3. Designing of a stand-alone multichannel spectrometer-calorimeter for detecting soft photons and using it to measure the polarization by the SPILER polarimeter at the output of a spin polarization source (SPI).
4. Determination of the critical region of multiplicity, at which the longitudinal and transverse components of the momentum become the same (the disappearance of the leading particle) and the establishment of its connection with the region of the pionic condensate formation.

Expected results of the activity in the current year:
1. Designing of electronics for reading and controlling silicon photomultipliers (SiPM) of a stand-alone multichannel spectrometer-calorimeter for detecting soft photons and using it to measure the polarization of the SPILER polarimeter at the output of a spin polarization source (SPI).
2. Manufacture of a spectrometer-calorimeter prototype together with colleagues from Belarus.
3. The detailed simulation of the deuteron-deuteron interaction at the planing beam energy.
4. Manufacture of scintillation counters based on vacuum PMTs, and, further, as a development of the workable concept, based on solid-state PMTs (SiPM). Reading control and presentation of the received information will be carried out directly at the source control panel workstation. Testing the prototype on the PNPI beam.
5. Participation in the development of a physics program at the future SPD facility with unpolarized and polarized beams of light nuclei and protons to study the behavior of multiplicity. Simulation of pp (dd, pd) interactions at energies up to 27 GeV.
6. Preparation of a physics program aimed at searching for collective phenomena in events with a large (exceeding average) multiplicity, in particular, the pion (Bose-Einstein) condensate discovered at the U-70 accelerator, excess soft photon yield, Cherenkov radiation of gluons by quarks, disappearance of the leading particle effect.
7. Detailed study of the parameters of the hadronization stage for charged and neutral mesons and baryons in the gluon dominance model.
8. Preparing the NEMAN project instead of activity.

Study of Polarization Phenomena and Spin Effects at the JINR Nuclotron-M/NICA Facility

Theme leader: E.A. Strokovsky

Deputies: N.M. Piskunov
V.P. Ladygin
R.A. Shindin

Participating countries and international organizations:
France, Japan, Romania, Russia, Slovakia, Sweden, United Kingdom, USA, Uzbekistan.

The problem under study and the main purpose of the research:
Polarization studies are undoubtedly relevant now. They combine the efforts of the JINR Laboratories and many foreign laboratories, both participating and non-participating countries, in the design and conduct of experiments using unique beams of polarized deuterons with energies ranging from 5 MeV per nucleon to 5.6 GeV/n, secondary beams of polarized protons and neutrons, as well as beams of polarized protons directly accelerated in the Nuclotron. The possibility of obtaining beams of accelerated polarized protons in the Nuclotron without significant investment, demonstrated in 2017, became the basis for intensifying work on the spin program of the NICA project and, in particular, for the development of polarimetry techniques, the creation of new methods for precise control of the direction of the spin of protons, deuterons and other particles. This part of the work on the topic is directly related to the creation of the NICA complex and the testing of a new approach to controlling the polarization in the spin transparency mode. Of undoubted interest is also the study of the possibility of setting up experiments at the collider to measure EDM and parity violation. Within the framework of the theme, two projects are being carried out: ALPOM-2 and DSS. Preparation of the project on spin effects measurements in nucleon-nuclear scattering with using Movable Polarized Target and modernized Delta-Sigma spectrometer is under consideration. Taking into account the presence of polarized beams, new experimental data will be obtained on the study of charge-exchange processes, on the study of the structure of 2- and 3-nucleon correlations in the reactions of deuteron-proton elastic scattering and deuteron breakup, by measuring tensor analyzing power and spin correlation in the dp scattering reaction in the deuteron core region, as well as other processes that are important for the development of theoretical models describing the interactions of the simplest nuclear systems with allowance for relativism and the contribution of the meson and quark-gluon components of the internal motion of constituents in nucleons.

Projects in the theme:

	Name of the project	Project Leaders	Project code
1.	ALPOM-2	N.M. Piskunov *Deputies:* E. Tomasi-Gustafsson C.F. Perdrisat V. Punjabi	02-1-1097-1-2010/2024
2.	DSS	V.P. Ladygin	02-1-1097-2-2010/2024

Projects:

Name of the project	Project Leaders	Status
Laboratory (Subdivision)	Responsible from laboratories	
1. ALPOM-2	**N.M. Piskunov** *Deputies:* **E. Tomasi-Gustafsson** **C.F. Perdrisat** **V. Punjabi**	Preparation Data taking
VBLHEP	S.N. Bazylev, O.P. Gavrishchuk, V.V. Glagolev, A.A. Druzhinin, D.A. Kirillov, K.S. Legostaeva, A.N. Livanov, P.A. Rukoyatkin, R.A. Shindin, I.M. Sitnik	

Brief annotation and scientific rationale:
At present, it is necessary to measure the analyzing powers of protons and neutrons in scattering on CH2, CH and other targets. Such data are necessary for experiments requiring measurements of the polarization of protons and neutrons in nuclear reactions. It also needs optimization hadronic polarimetry and expanding the database on analyzing powers both for protons, the

same for neutrons. This is possible only in Dubna, where polarized proton beams and neutrons obtained by fragmentation of accelerated polarized deuterons.

Expected results upon completion of the project:
Investigation of the analyzing powers in the scattering of polarized protons (at momenta up to 7.5 GeV) and neutrons (at momenta up to 6 GeV) on polyethylene, at the ALPOM-2 setup.

Expected results of the project in the current year:
Completion of the modernization of the setup (new drift chambers and a new wide-aperture hadron calorimeter), the beginning of measurements on beams of polarized nucleons.

2. DSS	**V.P. Ladygin**	Preparation Data taking
VBLHEP	E.V. Chernykh, Yu.V. Gurchin, A.Yu. Isupov, N.B. Ladygina, K.S. Legostaeva, A.N. Livanov, S.G. Reznikov, A.A. Terekhin, A.V. Tishevsky, I.S. Volkov	
DLNP	G.I. Lykasov	

Brief annotation and scientific rationale:
Study of the structure of 2- and 3-nucleon correlations in the reactions of deuteron-proton elastic scattering and deuteron decay by measuring the tensor analyzing power and spin correlation in dp-scattering reactions in the region of the deuteron nucleus, as well as other processes important for the development theoretical models describing the interactions of the simplest nuclear systems, taking into account relativism and the contribution of the meson and quark-gluon components of the internal motion of components in nucleons.

Expected results upon completion of the project:
Measurement of the structure of 2- and 3-nucleon correlations in deuteron-proton elastic scattering and mesonless decay of the deuteron in experiments on the internal target of the Nuclotron. Measurement of cross sections and analyzing powers of these reactions. Performing experiments on control of the proton spin on the internal target of the Nuclotron.

Expected results of the project in the current year:
Completion of the analysis of data on the analyzing powers A_y, A_{yy} and A_{xx} of the deuteron-proton scattering at energies 400-1300 MeV. Modernization of the proton polarimeter on the internal target. Publication of the results obtained on polarimetry and on deuteron analyzing powers deuteron-proton scattering up to an energy of 1800 MeV.

Activities:

Name of the activity Laboratory (Subdivision)	**Leaders** Responsible from laboratories	**Status**
1. Development of spin physics research infrastructure at the Nuclotron and other facilities. Design, construction and development of spin control and polarimetry systems. Consideration of new experiments on polarized beams of the NICA complex	**A.V. Butenko**	Realization
VBLHEP	A.V. Averyanov, Yu.N. Filatov, V.V. Fimushkin, A.S. Galoyan, D.O. Krivenkov, R.A. Kuzyakin, M.V. Kulikov, V.P. Ladygin, K.S. Legostaeva, A.N. Livanov, N.M. Piskunov, S.G. Reznikov, R.A. Shindin, E.A. Strokovsky, A.M. Taratin	
DLNP	Yu.N. Uzikov	
LIT	V.V. Uzhinsky	

Brief annotation and scientific rationale:
The possibility of obtaining beams of accelerated polarized protons in the Nuclotron without significant investment, demonstrated in 2017, became the basis for the intensification of work on the spin program of the NICA project and, in particular, for the development of polarimetry methods, the creation of new methods precise control of the direction of rotation of protons, deuterons and other particles. This part of the work topic is directly related to the creation of the NICA complex and the development of a new approach to management polarization in the spin transparency regime. Of undoubted interest is also the study the possibility of setting up experiments on the collider to measure the EDM and parity violation.

Expected results upon completion of the project:
Development of infrastructure for spin research at the Nuclotron-M/NIKA complex and other installations. Preparation of technical projects for spin control systems and polarimetry. Analysis of the possibility of setting up new experiments with polarized proton beams and deuterons at the NICA complex, in particular on the search for EDM.

Expected results of the project in the current year:
Creation of a project for the placement of elements of polarimetry for beam diagnostics and polarization control in the SPD section of the NICA collider ring. Completion of the modernization of the polarimeter in the F3 focus. Preparation of terms of reference for the manufacture of a proton polarimeter based on a cluster target.

Neutrino physics and astrophysics

02-2-1099-2010

Study of Neutrino Oscillations and Astrophysical Research

Theme leaders: D.V. Naumov
A.G. Olshevskiy

Participating countries and international organizations:
China, Czech Republic, France, Germany, Italy, Japan, Romania, Russia, Slovakia, Switzerland, Turkey, USA.

The problem under study and the main purpose of the research:
Measurement of the parameters of neutrino oscillations and other properties of neutrinos in experiments of various types, as well as astrophysical research in ground based and space experiments. Global analysis of data from neutrino experiments, development of experiments and creation of new type facilities.

Projects in the theme:

	Name of the project	Project Leaders	Project code

Brief annotation and scientific rationale:
Measurement of the neutrino mass hierarchy in the long baseline reactor experiment. Precise determination of the parameters of neutrino oscillations. Study of neutrino fluxes from various sources: the Sun, The Earth and others.

Expected results upon completion of the project:
Determination of the ordering of neutrino masses with an accuracy of > ~3 sigma, precision measurement of the spectrum of reactor antineutrinos, search for sterile neutrino states, measurement of solar and geoneutrino fluxes.

Expected results of the project in the current year:
Estimation of the accuracy of determining the neutrino mass hierarchy in the JUNO experiment, with an account for the near detector TAO. Testing of the JUNO and TAO detector elements and electronics. Installation of JUNO subsystems (PMT, HV, Veto) and preparation for data collection.

	VBLHEP	N.V. Gorbunov	

Brief annotation and scientific rationale:
Investigation of gamma radiation and charged cosmic rays (CRs) in the energy range of $10^{13}-10^{18}$ eV by detecting Cherenkov radiation from extensive air showers (EAS): studying the high-energy edge of the spectrum of the brightest galactic and extragalactic sources of gamma radiation, searching for galactic PeVatrons, applying a new hybrid approach to study mass composition of CRs in the range of 10^{14} -10^{17} eV, studying of CRs anisotropy in the energy range of 100 - 3000 TeV.

Expected results upon completion of the project:
Investigation of the energy spectrum of gamma quanta from Galactic sources and the search for new sources of gamma quanta. Monitoring of the flux of gamma rays from nearby extragalactic sources. Search for TeV gamma-rays from gamma ray bursts and gamma-rays correlated with high-energy neutrinos. Search for cosmic accelerators in which protons are accelerated to energies of 100 - 3000 TeV. Investigation of the mass composition of cosmic rays in the transition region from galactic to extragalactic rays.

Expected results of the project in the current year:
Data taking and analysis for reconstructing the spectrum of gamma rays from galactic sources (Crab nebula, Dragonfly, J2227+610 (G106.3+2.7), J2031 +415 (CygnusCocoon), Tycho-Brage supernova). Commissioning of the 4th Cherenkov telescope, installation of additional wide-angle detectors, fabrication and installation of the mount of the 5th Cherenkov telescope at the site. Development and preparation for operation of new Cherenkov detectors.

Brief annotation and scientific rationale:
Charged-lepton flavour-violating (CLFV) processes offer deep probes for new physics with discovery sensitivity to a wide range of new physics models – SUSY, Higgs Doublets, Extra Dimensions, and, particularly, models explaining the neutrino mass hierarchy and the matter- antimatter asymmetry in the Universe via leptogenesis. The most sensitive exploration of CLFV process is provided by experiments that utilize high intensity muon beams to search for CLFV $\mu \rightarrow e$ transitions: $\mu^+ \rightarrow e^+\gamma$ (experiment MEG at PSI); $\mu^+ \rightarrow e^+e^-e^+$(experiment Mu3e at PSI), and coherent neutrinoless conversion of a muon into an electron in the field of a nucleus $\mu^- N \rightarrow e^- N$, COMET (COherent Muon to Electron Transition) experiment at J-PARC.

COMET experiment will be implemented in two phases, Phase-I and Phase-II. The experimental sensitivity goal for this process in the Phase-I experiment is 3.1×10^{-15}, or the 90% upper limit of the branching ratio of 7×10^{-15}, which is a factor of 100 improvement over the existing limit. The expected number of background events is 0.032. To achieve the target sensitivity and background level, the 3.2 kW 8 GeV proton beam from J-PARC will be used. Two types of detectors, CyDet and StrECAL, will be used for detecting the μ-e conversion events and for measuring the beam-related background events in view of the Phase-II experiment, respectively.

The goal of the full experiment is a SES of 2.6×10^{-17}, which we refer to as Phase-II. This ultimate sensitivity goal is a factor of about 10,000 better than the current experimental limit $B(\mu^- + \mathrm{Au} \rightarrow e^- + \mathrm{Au}) \leq 7\times10^{-13}$ from SINDRUM-II at PSI.

Scientists from JINR are successfully participating in the preparation stage of the COMET experiment. For the COMET Phase-I experiment, JINR scientists produced and tested in accordance with the requirements the whole set about 2700 of 9.8-mm straw tubes. For Phase – II JINR scientists will make a full set of 5-mm straw tubes and will also take an active part in the development of the entire straw tracker, electromagnetic calorimeter and Cosmic Ray Veto (CRV) system as well as in assembly and maintanance of detectors and in further data analysis.

Expected results upon completion of the project:

1. Production of all thin-wall straw tubes. Different procedures of the tube tests for pressure, gas leakage and elongation, in accordance with the COMET requirements.
2. R&D for straw tubes with the diameter fo 5 mm and wall thickness of 12μm for the COMET Phase-II. For this purpose, we prepared a new straw line at DLNP.
3. Assembling, testing and installation of the 2nd and 3rd straw tracker stations for Phase-I.
4. Production of a full-scale straw station with a new type of straw tubes for Phase-I.
5. Development and optimization of a crystal calibration method for the calorimeter to be used in COMET Phase-I and Phase-II.
6. Assembling, testing, installation and operation of the calorimeter.
7. Implementation of a full-scale R&D program to create a cosmic veto system (CRV), providing determination of principles and parameters for the construction of complete CRV system. Manufacturing, assembling, testing of the CRV for Phase-α.

Expected results of the project in the current year:

1. Participation in the preparation, engineering and physics run of Phase-α.
2. R&D program for production of the straw tubes with the wall thickness of 12 μm and diameter of 5 mmwall. Measurement of all mechanical properties and development of standards for quality control of manufactured brand-new 5 mm diameter straw tubes.
3. Completion of assembly, testing, calibration, installation, cosmic test and maintenance of 2-3 straw detector stations for Phase-I.
4. Production of straw tubes (about 1000) for the full-scale prototype.
5. Production of a full-scale straw station at JINR with new tubes (12 μm, 5 mm).
6. Preparation for mass production and testing of straw tubes for Phase-II.
7. Development and optimization of a crystal calibration method for a COMET calorimeter, with allpwance the features of the experiment: the presence of a magnetic field and high-resolution calorimeter.
8. Participation in the full calorimeter assembling, installation, cosmic test and maintenance.
9. Participation in the assembling and testing of the CRV for Phase-I.
10. Participation in the beam tests of the detector components for Phase-I.
11. Integrated detector system (tracker, calorimeter, etc.) simulation.
12. Participation in the engineering and physics run in Phase-α.

Nuclear Physics (03)

03-4-1146-2024

Neutron nuclear physics

Theme leaders: Yu.N. Kopatch
P.V. Sedyshev
V.N. Shvetsov

Participating countries and international organizations:
Albania, Armenia, Azerbaijan, Belarus, Botswana, Bulgaria, CERN, China, Croatia, Czech Republic, Cuba, Egypt, Finland, France, Georgia, Germany, Hungary, IAEA, India, Italy, Japan, Kazakhstan, Moldova, Mongolia, North Macedonia, Poland, Republic of Korea, Romania, Russia, Serbia, Slovakia, Slovenia, South Africa, Switzerland, Thailand, Turkey, USA, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:
Nuclear physics research with neutrons is traditionally one of the priority areas developed at JINR. These studies are carried out within the framework of the scientific theme "Investigations of neutron nuclear interactions and properties of the neutron" (03-4-1128-2017/2023). The integrated use of the FLNP basic facilities (IREN pulsed source of resonance neutrons, IBR-2 pulsed reactor, EG-5 electrostatic generator, as well as TANGRA facility) makes it possible to conduct nuclear physics research in a wide range of neutron energies from cold neutrons to ~20 MeV, and the use of external neutron sources, such as the n_TOF neutron time-of-flight facility at CERN, allows expanding the energy range to several hundreds of MeV.

The research and development activities within the framework of the theme are aimed at implementing the tasks formulated in the proposals for the JINR Seven-Year Development Plan 2024–2030 in the field of "Nuclear Physics". The physics investigations can be grouped into three research areas:

1. Study of violations of fundamental symmetries in the interactions of neutrons with nuclei, obtaining nuclear data.
2. Study of fundamental properties of the neutron, physics of ultracold and very cold neutrons.
3. Applied and methodological research.

The scientific program of the theme "Neutron Nuclear Physics" will be implemented within the framework of three projects: two scientific ones ("Investigations of neutron nuclear interactions and properties of the neutron" and "TANGRA") and one scientific and technical project ("Modernization of the EG-5 accelerator and its experimental infrastructure"). Work on the development of the concept of a UCN source at a pulsed reactor is planned to be singled out as a separate activity.

Projects in the theme:

	Name of the project	Project Leader	Project code
1.	Development and elaboration of the tagged neutron method for determining the elemental structure of matter and studying nuclear reactions (TANGRA – Tagged Neutrons and Gamma Rays)	Yu.N. Kopatch	01-3-1146-1-2014/2028
2.	Modernization of the EG-5 accelerator and its experimental infrastructure	A.S. Doroshkevich	01-3-1146-2-2022/2026
3.	Investigations of neutron nuclear interactions and properties of the neutron	V.N Shvetsov P.V. Sedyshev	01-3-1146-3-2024/2028

Projects:

	Name of the project Laboratory (Subdivision)	Project Leader Responsible from laboratories	Status
1.	**Development and elaboration of the tagged neutron method for determining the elemental structure of matter and studying nuclear reactions (TANGRA - Tagged Neutrons and Gamma Rays)**	**Yu.N. Kopatch**	Upgrade Data acquisition Data analysis

FLNP	N.A. Fedorov, D. Grozdanov, C. Hramco, V.R. Skoy, V.N. Shvetsov, T.Yu. Tretiakova
VBLHEP	V.Yu. Aleksakhin, S.V. Khabarov, Yu.N. Rogov, M.G Sapozhnikov, V.M. Slepnev, N.I. Zamiatin, E.V. Zubarev
DLNP	A.V. Krasnoperov, A.B. Sadovskii, A.V. Salamatin

Brief annotation and scientific rationale:
Information about neutron-nuclear interactions is extremely important for both fundamental and applied physics. The fact that the neutron has no electric charge makes it a unique probe for studying nuclear forces. Due to electrical neutrality, the high penetrating power of neutron radiation makes it promising for studying the structure of matter at both the nuclear and molecular levels. Neutrons are also widely used for applied purposes: in inspection systems, non-destructive elemental analysis facilities, in instruments for studying the immediate environment of boreholes (logging), as well as in the creation of neutron and gamma radiation detectors used on board orbital and descent spacecraft for analysis of soil and atmosphere of celestial bodies. Information about neutron-nuclear reactions is also necessary for the design of promising nuclear power facilities, as well as for modeling various devices and objects that interact with neutron radiation in one way or another. An indicator of the relevance of studying the characteristics of neutron-nuclear interactions can be the fact that the list of the most requested nuclear data for the most part consists of queries directly related to neutron-nuclear reactions.

The TANGRA (TAgged Neutrons and Gamma Rays) project is aimed at studying neutron-nuclear reactions using the tagged neutron method, finding new ways to use neutron methods in fundamental and applied research, improving existing and creating new approaches to processing the results of nuclear physics experiments. One of the tasks to be solved within the framework of the project is the interpretation of existing experimental data on the reactions of interaction of fast neutrons with atomic nuclei, their systematization and validation. The priority area of work is the acquisition of nuclear data.

Expected results upon completion of the project:
1. Performing experiments to study the angular distributions of scattered neutrons.
2. Experimental study of (n,γ) and (n',γ)-correlations.
3. Theoretical description of the studied reactions.
4. Conducting experiments to study the reaction (n,2n).
5. Conclusion on the applicability of the tagged neutron method for elemental analysis of soils. In case of a positive result, the creation of prototypes of stationary and mobile facilities, as well as methodological recommendations for their use for agricultural and environmental monitoring.

The results obtained during the implementation of this project will be valuable for both fundamental and applied science. The obtained experimental data on the yields and angular distributions of γ-rays can be used to increase the accuracy of Monte Carlo simulations of various physics facilities. Another planned application of the obtained experimental results is fast elemental analysis. Optimized model parameters can be used to theoretically describe previously unstudied reactions. The developed prototypes of facilities for elemental analysis of soils can become the basis for creating devices useful for intensifying agriculture and monitoring the state of the environment.

Expected results of the project in the current year:
1. Measurements of total and differential cross sections of characteristic gamma lines for various elements using high-resolution detectors of γ-rays.
2. Development of an experimental setup for studying (n'γ) correlations and performing test measurements.
3. Implementation of a part of the experimental program for the development and verification of a methodology for measuring carbon concentrations in soil.
4. Simulation of a facility for measuring carbon concentration in soil to develop a method for deep profiling of macroelement concentrations.

2. Modernization of the EG-5 accelerator and its experimental infrastructure

FLNP	I.A. Chepurchenko, R.Sh. Issaev, Yu.N. Kopach, A.N. Likhachev, V.N. Semenov, K.E. Studnev, S.N. Tkachenko, K.N. Udovichenko, I.A. Zaitsev, T.Yu. Zeleniak

Brief annotation and scientific rationale:
The project is aimed at modernizing the main systems of the electrostatic charged particle accelerator EG-5, developing ion-beam and complementary methods for studying the elemental composition and physical properties of near-surface layers of solids.

***Goals of the project**:* to provide technical feasibility for the implementation of the scientific program of the JINR Topical Plan in studying reactions with fast quasi-monoenergetic neutrons; development of nuclear physics methods for studying the elemental composition; solution of problems of neutron-radiation materials science; implementation of practical applications of neutron physics; ensuring technical feasibility for the implementation of the unique options of the microbeam spectrometer.

Objectives of the project. The main technical task of the project is to restore the energy range of accelerated particles of 900 keV – 4.1 MeV and increase the ion beam current to 100–250 μA while maintaining the energy stability of the ion beam at a level no worse than 15 eV, ensuring the spatial stability of the ion beam, sufficient to implement the option of the microbeam spectrometer / nuclear microprobe.

The main organizational task is the formation and development of human resources potential to ensure the full implementation of the project for at least 3 seven-year periods.

The objectives of the project also include the upgrade of the experimental infrastructure of the accelerator complex, in particular, the development of new methods for studying the physical properties of the surface of materials that can complement and improve the quality of the obtained scientific results, the intensification of international scientific and technical cooperation, the organization of user policy, the formation of an interlaboratory accelerator center on the basis of FLNP JINR to solve a wide range of unique scientific and technological problems.

The main criteria for the successful implementation of the project are providing a neutron flux sufficient to conduct nuclear physics experiments with fast neutrons, and an energy stability of the ion beam sufficient to create a microbeam spectrometer/nuclear microprobe.

Expected results upon completion of the project:
As a result of the implementation of the project, the technical parameters of the accelerator will be restored (energy of accelerated particles of 4.1 MeV at a maximum current of at least 100 μA), which will make it possible to conduct studies of reactions with fast neutrons at JINR, as well as provide technical conditions for the installation of a microbeam spectrometer. A neutron generator based on a solid-state lithium target with a moderator will be added to the existing neutron generator with a gas target, and the chamber for irradiating samples with ion beams will be modified.

A new specialized laboratory will be created for the preparation of objects of study, which will be equipped with complementary methods for studying the optical and electronic properties of the surface, such as ellipsometry, optical and electron microscopy, methods for studying electrical properties at direct and alternating current (voltammetry, impedancemetry).

In addition to modernization and expansion of the instrumental base of the accelerator complex, the formation of personnel potential for the next 20-30 years will be carried out. The available methods of elemental analysis will be supplemented by methods of analysis based on prompt gamma rays from inelastic neutron scattering and neutron activation analysis.

Modernization of EG-5 at JINR, where there are highly qualified specialists, good detecting equipment and valuable developments in the field of neutron investigations of atomic nuclei, will make it possible in the short term to conduct a number of new, unique experiments on obtaining the energy spectra and angular distributions of charged particles from (n, α) and (n, p) / (α, n) and (p, n) reactions and integral and differential cross sections of the latter in the neutron energy range up to ~6 MeV, on processes of fission of atomic nuclei by fast neutrons, activation analysis, experiments in the field of neutron materials science and etc.

Expected results of the project in the current year:
– certification and commissioning of the EG-5 accelerator and its experimental halls in test mode;

– replacement of the worn high-voltage accelerating tube and ion source that has lost its performance characteristics.

– reaching an ion beam current of over 100mkA;

– improvement and adjustment of the parameters of the ion optics of the EG-5 accelerator (reconfiguration from the focussator mode to the condenser);

– modernization and automation of the gas cylinder economy, adaptation of the technological scheme;

– modernization of the vacuum system;

– automation of all accelerator service systems;

– launch of a laboratory for engineering and sample research using complementary ion-beam methods;

– formation of the personnel potential of the group;

– implementation of technical projects, in particular, a project with JSC “Micron” “Carrying out preparatory work, including the manufacture of an ion beam scanning system in a raster, as well as test electron beam processing and testing using impedance

spectroscopy of semiconductor wafers with a diameter of 150 mm in an amount of up to 20 pcs.", a technical project with the State Corporation "ROSATOM" "Investigation of the dependence of the sensitivity of the UDKN-04R device on neutron energy", projects with Angstrom JSC, etc.

3. Investigations of neutron nuclear interactions and properties of the neutron

Brief annotation and scientific rationale:

Nuclear processes and structural changes in materials induced by slow, resonance and fast neutrons and accelerated charged particles are traditionally in the focus of research attention at FLNP JINR. The interaction of neutrons with atomic nuclei is of interest for both fundamental and applied research.

The integrated use of the FLNP basic facilities (IREN pulsed source of resonance neutrons, IBR-2 pulsed reactor, EG-5 electrostatic generator) makes it possible to conduct nuclear physics research in a wide range of neutron energies from cold neutrons to ~20 MeV, and the use of external neutron sources, such as the n_TOF neutron time-of-flight facility at CERN, allows expanding the energy range to several hundreds of MeV. Fundamental research carried out at the FLNP Department of Nuclear Physics includes studies on the violation of space and time symmetry, the mechanism of nuclear reactions, the structure of atomic nuclei, fission processes induced by neutrons, neutron-induced reactions with the emission of light particles, the properties of the neutron as an elementary particle, the properties of ultracold and very cold neutrons, quantum mechanical effects involving neutrons.

Also, in FLNP, a variety of research programs has been developed for applied investigations, such as obtaining nuclear data and information on the radiation resistance of materials for nuclear technologies, power engineering and transmutation, radiation mutagenesis on fast neutrons, neutron activation analysis using thermal and epithermal neutrons, neutron activation analysis using prompt gamma-rays, elemental analysis using neutron resonances, elemental analysis using fast neutrons, analysis of the elemental composition of thin films, investigation of the radiation resistance of materials to the effects of accelerated charged particles on electrostatic accelerator beams, development of radiation-resistant nanostructured materials using accelerated ion beams.

Expected results upon completion of the project:

1. Refinement of characteristics of known resonances and detection of previously unknown ones. Measurement of reaction cross sections and product correlations in the resonance region with an accuracy sufficient to study P- and T-odd effects.
2. Performing experiments to study TRI and ROT effects in fission, measuring the mass-energy and angular distributions of fragments, prompt neutrons and gamma-rays; searching for rare and exotic fission modes, using both IBR-2 and third-party sources.
3. Conducting experimental and theoretical studies of neutron-nuclear reactions in a wide range of energies of incident particles.
4. Investigation of the pattern of nonstationary neutron diffraction by surface acoustic waves. Verification of the validity of generally accepted laws of neutron optics in the case of large accelerations.

5. Development of models for calculating the transport of UCN and CN in the material of nanodiamond reflectors and the extension of their applicability to the range of thermal neutrons.
6. Study of the structure of graphites after their intercalation and measurement of cross sections for cold neutron scattering by intercalated graphites.
7. Obtaining data for nuclear power engineering and astrophysics: measurement of integral and differential neutron cross sections, angular correlations in the energy range from cold neutrons to hundreds of MeV.
8. Study of radiation resistance of various materials, including those promising for use as neutron reflectors and moderators. Development and study of radiation resistance of electronic components, including those operating on new physical principles.
9. Development of energy and electronics devices using powder nanotechnology and ion beams.
10. Obtaining new data and monitoring the environmental situation in certain regions of the JINR Member States with the help of NAA.
11. Study of the influence of neutron irradiation on the properties of biological objects and tissues.
12. Investigation of layered structures, including high-temperature superconductors using RBS, ERD and PIXE techniques.
13. Performing elemental analysis of various objects of cultural heritage.

Expected methodological results:

1. Development of the method of neutron spin interferometry with UCN.
2. Determination of optimal technologies for the synthesis and modification of substances for use as UCN and CN reflectors.
3. Development of methods for cleaning water and soil, and assessing the quality of food products.
4. Study of the processes of accumulation of nanoparticles in the organs of animals and plants, assessment of their impact on the health of living objects under study.
5. Development of a technique for non-destructive elemental analysis using prompt gamma-rays. Improvement of existing methods of activation analysis using thermal and resonance neutrons.
6. Performing work on the manufacturing of electronics and ionizing radiation sensors based on new physical principles.

The fundamental results obtained during the implementation of the project will be of great importance for understanding the mechanisms of neutron-nuclear reactions and the development of theoretical ideas about these processes. The study of P- and T-odd effects will provide information on the contribution of the weak interaction to nuclear forces and can serve as an alternative method for determining the mixing coefficient Vud of a CKM matrix. Obtaining new information about ROT and TRI effects, as well as exotic fission modes, will make it possible to clarify the features of one of the stages of this process – the scission of a fissile nucleus into fragments. The data obtained during the implementation of the neutron-optical part of the project will be needed to create new neutron moderators and reflectors. In addition, they will allow significant progress in the development of neutron microscopy methods and studies of the magnetic structure of various objects. The implementation of the applied research program of the project will be of great social importance and contribute to the progress of environmental, materials science, archaeological, and nanotechnological investigations, as well as promising developments in the field of modern electronics and energy. The techniques of elemental and structural analysis being created and modernized will be in demand in many branches of human activity.

Expected results of the project in the current year:

1. Preparation for measurements of P- and T-violation effects at the IREN facility. Carrying out test experiments to study the angular distributions of gamma-rays from resonance capture.
2. Modernization of the ENGRIN facility and measurement of prompt fission neutron multiplicity and mass-energy distributions of $^{235}U(n_{res},f)$ reaction products with higher accuracy.
3. Development and construction of a prototype setup for measuring angular correlations in the vicinity of p-wave resonances in medium-heavy and heavy nuclei on beamline 4 of the IREN facility: calculation and creation of shielding, determination of beam parameters, test measurements.
4. Reconstruction of a large liquid scintillation detector on a 60-m flight path of the IREN facility.
5. Determination of the elemental composition of a number of archaeological samples using neutron resonance analysis at the IREN facility.

6. Purchase of materials and equipment for the development and construction of a facility for studying the ROT effect on beamline 1 of the IBR-2 reactor. Performing test measurements of the angular distributions of prompt neutrons and gamma-rays emitted during the fission of uranium nuclei.

7. Obtaining the results of an experiment to search for the true and pseudo-quaternary fission of ^{252}Cf. Start of a project to modernize the instrument using more advanced Timepix3 detectors.

8. Development of a compact scintillation detector using a micropixel avalanche photodiode.

9. Measurements of cross sections for ^{6}Li(n,α) and ^{148}Sm(n,α) reactions with fast neutrons.

10. Measurement of the forward-backward asymmetry coefficient in the reaction (n,p) for ^{35}Cl in the resonance energy region.

11. Carrying out measurements of cross sections of (n,p) and (n,α) reactions using gas samples (nitrogen, neon).

12. Assessment of atmospheric precipitation of heavy metals in the JINR Member States.

13. Development of new methods of remediation of soils and wastewater.

14. New results on the study of the effect of metal nanoparticles and neutron radiation on living organisms.

15. Study of the possibility of setting up a new experiment with UCN to test the weak equivalence principle with an accuracy of 10^{-4}.

16. Measurement of the Goos-Hänchen shift in the experiment on the total reflection of a neutron wave from a resonance structure (provided that the beamtime is available at a modern high-resolution neutron reflectometer).

17. Completion of studies of hydrogen-containing impurities in fluorinated detonation nanodiamonds (FDND).

18. Carrying out studies of the radiation resistance of FDND oxide, metal and high-entropy compounds.

19. Measurement of neutron scattering cross sections of DND powder depending on its density, as well as of fluorinated intercalated graphite.

20. Completion of development of the concept of a UCN source on the basis of a pulsed reactor.

21. Obtaining mutants for breeding drought-resistant and saline soils of rice and wheat varieties.

22. Development of homogeneous electronics and adsorption energy devices for critical and promising construction technologies.

Activities:

	Name of the activity	**Leaders**	**Implementation period**
	Laboratory (Subdivision)	Responsible from laboratories	
1.	**Development of the conceptual design of an ultracold neutron source on a pulsed reactor**	**G.V. Kulin** **A.I. Frank**	2024-2025
	FLNP	L.V. Mitsyna, A.Yu. Muzychka, A.Yu. Nezvanov, Yu.N. Pokotilovski, V.A. Strelkov, K. Turlybekuly, M.A. Zakharov, + 2 engineers, + 1 worker	

Brief annotation and scientific rationale:

Since the discovery of ultracold neutrons (UCN), a number of intense UCN sources have appeared in the world, and several more of them are under construction. There is no UCN source in Dubna, which is largely due to the features of the IBR-2M reactor. Its average power of 2 MW is relatively low for creating a steady-state UCN source, while the repetition rate of 5 Hz is too high to accumulate neutrons produced in each individual pulse. However, the pulsed flux of thermal neutrons from the reactor is very high, since the interval between pulses is hundreds of times longer than their duration.

A specific feature of the future UCN source at JINR is the pulsed filling of the trap, when neutrons arrive in it only during the pulse, while the rest of the time the trap remains isolated. The practical implementation of this idea is hindered by the fact that, due to the presence of biological shielding, the trap is far from the moderator in which UCNs are generated, and has to be connected to it by a transport neutron guide. In this case, the spread of transport flight times can significantly exceed the intervals between pulses, which makes the very idea of accumulation meaningless. To solve this problem, it was proposed to use a special device — a temporary lens that changes the energy of neutrons in a dosed manner as they arrive at this lens. Such a device makes it possible to restore the pulsed structure of the neutron beam immediately before entering the trap.

Recently, the idea of pulsed filling of a UCN trap has been the subject of intense discussion in the literature. Alternative approaches to time focusing of neutrons and methods for slowing down faster, so-called very cold neutrons (VCN) to energies characteristic of UCN have emerged. There have appeared theoretical works devoted to aspects of the formation of a neutron pulse by a time lens, as well as to the features of the time structure of a neutron beam when using a flipper moderator with a strong magnetic field. As a result, a significant number of ideas and proposals have emerged that can form the basis of a project for a new UCN source.

The aim of the work within the framework of "Activities" is to formulate the concept of a UCN source in a pulsed reactor on the basis of an analysis of both existing and some new ideas regarding the transport of UCN, the evolution of the duration of neutron bunches and the formation of the optimal time structure of bunches at the entrance to the trap. This can be either the IBR-2M reactor available at FLNP or the NEPTUN reactor currently being designed. It is expected that the final UCN spectrum at the entrance to the trap will be formed by slowing down the VCN.

Expected results upon completion of the activity:
Development of a conceptual design for an ultracold neutron (UCN) source at a pulsed reactor.

Expected results of the activity in the current year:
1. Development of a design for a neutron flipper-moderator with an energy transfer of the order of μeV.
2. Selection of a fast shutter design that ensures pulsed filling of the UCN trap and minimally affects the density of neutrons stored in the trap.
3. Analysis of possible variants of a UCN converter-moderator, which would provide the highest UCN flux density at the desired pulse duration.

Synthesis and Properties of Superheavy Elements, Structure of Nuclei at the Limits of Nucleon Stability

Theme leader: S.I. Sidorchuk

Deputy: A.V. Karpov

Scientific leader: Yu. Ts. Oganessian

Participating countries and international organizations:
Belarus, Bulgaria, China, Germany, India, Italia, Kazakhstan, Mongolia, Republic of Korea, Romania, Russia, Slovakia, South Africa, Switzerland, Vietnam.

The problem under study and the main purpose of the research:
Synthesis of nuclei at stability limits and the investigation of their properties. Investigation of the mechanisms of heavy-ion-induced reactions. Study of the physical and chemical properties of heavy and superheavy elements.

Projects in the theme:

	Name of the project	Project Leaders	Project code
1.	Investigation of heavy and superheavy elements	M.G. Itkis A.V. Karpov	03-5-1130-1-2024/2028
2.	Light exotic nuclei at the borders of nucleon stability	G. Kaminski S.I. Sidorchuk *Deputies:* V. Chudoba A.S. Fomichev	03-5-1130-2-2024/2028

Brief annotation and scientific rationale:
The Project aims to study the heaviest nuclei and atoms in a comprehensive way: conducting experiments on the synthesis of elements with Z=119 and 120; synthesizing new isotopes of superheavy elements; studying nuclear (spectroscopy) and chemical properties of superheavy elements; investigating nuclear reaction dynamics, including multi-nucleon transfer, leading to the formation of neutron-rich heavy nuclei.

The project will be implemented mainly at the Superheavy Element Factory of JINR commissioned in 2020. The studies on nuclear reaction dynamics will be carried out at the U-400 accelerator complex and will proceed at the U-400R following the upgrade.

Expected results upon completion of the project:
1. Synthesis of new superheavy elements 119 and 120.
2. Study of the chemical properties of SHE.
3. Synthesis of superheavy nuclei and study of their decay properties.
4. Investigation of the chemical properties of superheavy elements.
5. Spectroscopy of the radioactive decay of heavy and superheavy nuclei.
6. First experiments aimed to measure the masses of superheavy nuclei.
7. Study of the dynamics of heavy-ion nuclear reactions.

Expected results of the project in the current year:
1. Experiments at the DGFRS-2 separator of the SHE Factory aimed to study production cross sections of nuclei in reactions with ^{48}Ca, ^{50}Ti, ^{54}Cr, ^{58}Fe ions and the properties of synthesized nuclei.
2. Test experiments for synthesizing elements with Z>118.
3. Experiments aimed at studying the properties of the radioactive decay (α-, β-decay, spontaneous fission properties) of short-lived isotopes with Z>100 (No, Rf, and Sg) produced in reactions with Ne, Ca, Ti, and Cr ions at the SHELS and GRAND (DGFRS-3) separators using the GABRIELA and SFiNX detecting systems.
4. Experiments for studying the chemical properties of Cn and Fl at the SHE Factory.
5. Development of methods for manufacturing accelerating targets of stable and radioactive isotopes, stable under long irradiation with high-intensity heavy-ion beams.
6. Development of techniques for producing metal-organic alloys of titanium and chrome for accelerating their ions using the MIVOC method.
7. Investigation of mass-energy and angular distributions of fragments formed in multinucleon transfer reactions.
8. Study of the entrance channel influence on the mass-energy and angular distributions of fragments formed in heavy-ion reactions.

2. Light exotic nuclei at the borders of nuclear stability

G. Kaminski

Stepantsov, S.S. Stukalov, G. M. Ter-Akopian, A.N. Vorontsov, R. Wolski, D. Yertaeva

Brief annotation and scientific rationale:
The investigations aim to study the structure of light nuclei and nuclear systems near and beyond the borders of nuclear stability using direct nuclear reactions (charge-exchange, one- or two-nucleon transfer), to investigate rare decay channels and the influence of reaction mechanisms on the observed properties of the studied nuclei. Direct reactions employed for studying the structure of isotopes near the borders of nuclear stability allow for more reliable data acquisition and the revision of existing

knowledge. The experimental programme will be mainly implemented at the ACCULINNA-1,2 and MAVR setups using the upgraded U-400M accelerator complex of FLNR JINR that allow a wide range of experimental studies of light exotic nuclei using secondary beams in the energy range of 5–50 MeV/nucleon.

The ACCULINNA-2 separator is equipped with a radio frequency filter for additional purification of secondary beams, a magnetic spectrometer for reaction product separation, a cryogenic target complex of hydrogen and helium isotopes, an array of neutron detectors based on stilbene crystals, and systems for the registration of charged particles.

Expected results upon completion of the project:

1. Study of the properties of the drip-line isotopes of light nuclei.
2. First experiments using the tritium target.
3. Structure of the drip-line isotopes of light nuclei in (d,p) and (d,n), (t,p), (t,a), (p,d), etc. reactions.
4. Studies of exotic decays, including 2-n, 4-n, and 2-p emission.

Expected results of the project in the current year:

1. Study of nuclei near the boundaries of nucleon stability. Conduct of the first experiment ^{6,8}He+^{4}He. Preparation for and conduct of experiments at the ACCULINNA-2 fragment separator using radioactive beams and the cryogenic targets H_2, D_2, ^{3}He,^{4}He.
2. Investigation of the isotopes of oxygen and fluorine at nucleon drip-lines using the missing mass method at the MAVR set-up.
3. Experiments on measuring the cross sections of individual reaction channels at ACCULINNA-1 employing the MULTI spectrometer.

Non-Accelerator Neutrino Physics and Astrophysics

Theme leaders: E.A. Yakushev
S. Rozov

Participating countries and international organizations:
Belgium, Czech Republic, France, Germany, Italy, Japan, Russia, Slovakia, Switzerland, United Kingdom, USA.

The problem under study and the main purpose of the research:
Search for and investigation of double-neutrino and neutrinoless modes of double beta decay, clarification of the neutrino nature, Majorana or Dirac, and absolute neutrino mass scale and hierarchies. Search for the neutrino magnetic moment and Dark Matter. Use of the neutrino detector for a distant investigation of processes inside the reactor core of the Kalinin Nuclear Power Plant. Search for the signal produced by coherent reactor neutrino scattering. Precision study of the coherent scattering spectrum to search for manifestations of New Physics. Search for sterile neutrinos. Spectroscopy of nuclei far from stability. Development of new methods for charged and neutral particle detection. Development of methods for the preparation and purification of radionuclide production for the synthesis of radiopharmaceuticals. Application of hyperfine interaction methods to study radiopharmaceuticals and their precursors. Development and application of methods and techniques for the preparation and analysis of low-background materials with ultra low content of radioactive impurities.

Brief annotation and scientific rationale:
The project is aimed at the development of nuclear spectroscopy and radiochemistry methods, including for purposes of astrophysics and neutrino physics. It involves new particle detection techniques, calibration, background description, uniquely pure materials, etc., and also nuclear medicine isues such as production and purification of radioisotopes, development and synthesis of radiopharmrceuticals, study of influence mechanisms on substance at radionuclides decay locations, etc.

Specific areas are:
1. Novel detectors (semiconductor detectors, liquid and plastic organic scintillators, composite scintillation detection systems, neutron and radon detectors, etc.).

2. "Post-decay" spectroscopy of electrons and other emissions with an emphasis on extremely low energies.

3. Traditional gamma-spectroscopy based on semiconductor detectors (SPDs) with an emphasis on the determination precision for the emission energy and activity of the sources (pointlike and volumetric) to study decay modes and determine cross sections of nuclear reactions.

4. Application of hyperfine interaction (HFI) methods using radioactive tracers, namely the method of perturbed angular correlation (PAC) and the emission mode of Mössbauer spectroscopy for the study of radiopharmaceuticals and their precursors in water-containing systems and other matrices.

5. Development of production and purification methods of radionuclide preparations for the radiopharmaceuticals synthesis, including development of generator routes for their production, physicochemical methods for evaluating properties of radionuclides and radiopharmaceuticals (their precursors) in homogeneous and heterogeneous systems.

6. Development and application of methods and techniques for production and analysis of low-background materials with a uniquely low content of radioactive impurities, in particular using inductively coupled plasma mass spectrometry (ICP-MS) and other analytical and nuclear spectroscopic methods.

Utilization of nuclear spectroscopy and radiochemistry methods in studying neutrino properties, searching for dark matter particles, and researching rare and other physical processes have firmly and deservedly proved effective in numerous experiments on these topics of fundamental physics. Almost the same can be said about their role in nuclear medicine. Thus, the relevance of this topic is undeniable. A key to the scientific novelty of the project is a focus on development the techniques and methods that allow expanding the horizon of the declared target experiments.

Expected results upon completion of the project:
1. New detectors:
   – development and application of detectors based on silicon carbide (SiC) for nuclear radiation registration. SiC detectors that have high radiation resistance (10 times higher than silicon) and operability at high temperatures > 400°C are planned to be used for monitoring operation of high-current accelerators and nuclear reactors and for hot plasma diagnostics;

   – development and investigation of liquid tellurium-containing scintillators for the search for double neutrinoless β-decay, as well as other types of liquid and plastic scintillators;

   – development of composite scintillation registration systems for neutrino experiments;

   – development and application of ^{3}He counters for detecting low neutron fluxes (below of 10^{-6} n×cm^{-2}×s), development of a compact sensitive radon detector, development of technology for production of low-radioactive parts using 3D printing.

2. Experimental study of low-energy electron spectra (0 -50 keV) on the ESA-50 spectrometer and gamma and X-ray radiation spectra on the SCD during radioactive decay to obtain new data on low-excited states of nuclei and post-decay relaxation of atomic systems, search for ways to perform spectrometry of post-decay photons (from the edge of infrared radiation to soft X-rays) in the energy range 1-200 eV.

3. Development of technique for modelling codes application (Geant4, MCNP and FLUKA) of the HPGe spectrometer characteristics at the LINAC-200 electron accelerator to determine the yields of photonuclear reactions and at other JINR basic facilities, investigation of decay modes study of a wide range of radionuclides and their content in samples (^{96}Zr, ^{40}K, ^{138}La, etc.) to study rare processes.

4. Improvement of the methods of perturbed angular correlations (PAC) and Mössbauer spectroscopy (emission mode) using radioactive tracers ^{111}In, ^{152}Eu, ^{154}Eu, ^{119}Sb, ^{119m}Sn, ^{57}Co, ^{161}Tb, etc., to study of radiopharmaceuticals and their precursors (components) in aqueous systems and other matrices and development of physicochemical methods for evaluation of properties of radionuclides and radiopharmaceuticals in homogeneous and heterogeneous systems.

5. Radiochemistry and nuclear medicine: the study of sorption processes for various solution-sorbent systems as a chemical basis of the purification methods (for low-background materials as well) and preparation of radionuclide generators for production of radiopharmaceuticals;

– development of the method for production of radionuclides and their isolation (including mass separation) from targets irradiated with protons, neutrons and gamma quanta for production of radiopharmaceuticals (^{103}Pd, ^{119}Sb, ^{161}Tb, some alpha emitters, etc.);

– development of a wide range of radionuclide generators (^{44}Ti → ^{44}Sc, ^{68}Ge → ^{68}Ga, ^{90}Sr→ ^{90}Y, ^{238}U→ ^{234}Th, ^{237}Np → ^{233}Pa, ^{229}Th → ^{225}Ac, ^{227}Ac→ ^{227}Th → ^{223}Ra, ^{202}Pb → ^{202}Tl, ^{194}Hg → ^{194}Au, ^{32}Si → ^{32}P, etc.) will be continued based on reverse-tandem methods to expand the possibilities of production of medical radionuclides. The possibility of producing 1-2 generators of significant activity for external users will be considered;

– development of radiolabeling methods based on chelators with "slow" kinetics for synthesis of radiopharmaceuticals, study of radium chelation.

6. Development and implementation of sample production methodes (^{82}Se, ^{96}Zr, shielding materials, solder, etc.) for astrophysical and neutrino problems at a new ultra-low level of impurity content (from mBq/kg to μmBq/kg of Th and U). The main approaches to solving the above problems are the use of reverse chromatography, low-boiling and other prepared or selected reagents, the use of selected and prepared reactor materials;

– development and implementation of sample analysis methods at an ultra-low sensitivity level (from mBq/kg to μmBq/kg of Th and U) using ICP-MS, neutron activation analysis (NAA) and other methods, development of methods for precise determination of the chemical and isotopic composition of materials used in astrophysical and neutrino experiments.

Expected results of the project tin the current year:

1. New detectors:
– results of tests of new SiC detectors for nuclear radiation detection;

– parameters of new liquid tellurium-loaded scintillators developed and created at JINR;

– R&D results for composite scintillation detection systems for next-generation neutrino experiments; Development of a prototype of a satellite detector for large reactor experiments;

– a new ^{3}He-counter with low internal background, results of the test measurements in Dubna and an underground laboratory;

– technology for production of low-radioactive parts using 3D printing.

2. Establishing ways to perform spectrometry of post-decay photons (from the edge of infrared radiation to soft X rays) in the energy range 1-200 eV.

3. Determination of photonuclear reaction yields, results of precise study of decay modes for a wide range of radionuclides, and their content in samples (^{96}Zr, ^{40}K, ^{138}La, etc.) to study rare processes.

4. Upgrade of perturbed angular correlation spectrometers and commissioning of new setups for Mössbauer spectroscopy (emission mode) using radioactive tracers ^{111}In, ^{152}Eu, ^{154}Eu, ^{119}Sb, ^{119m}Sn, ^{57}Co, ^{161}Tb.

5. Radiochemistry and nuclear medicine: results of studying sorption processes for various solution-sorbent systems.

6. Development and implementation of methods for obtaining samples (^{96}Zr) for astrophysical and neutrino problems at a new ultra-low impurity level;

– begining of implementation of the method for sample analysis at an ultra-low sensitivity level (from mBq/kg to μmBq/kg of Th and U) using ICP-MS.

Brief annotation and scientific rationale:

The project combines the experiments: DANSS, RICOCHET and νGeN devoted to the study of antineutrino fluxes from nuclear reactors at distances of less than 20 m. Experiments are united by a common area of research, in many respects scientific problems overlapping and coinciding, and ways to solve them. In addition, these studies are united by the common JINR staff and infrastructure resources.

DANSS is an antineutrino spectrometer based on plastic scintillators with a sensitive volume of 1 m^3, located at the fourth power unit of the Kalinin NPP. The lifting mechanism makes it possible to move the spectrometer 2 m vertically in the on-line mode, providing a measurement range of 11–13 m from the reactor. The high degree of detector segmentation and the use of combined

active and passive shielding ensure background suppression down to several percent relative to ~5000 IBD events recorded per day.

The νGeN experiment is aimed at studying the fundamental properties of neutrinos, in particular searching for the neutrino magnetic moment (NMM), coherent elastic neutrino scattering (CEνNS), and other rare processes. The νGeN spectrometer is located under the Kalinin nuclear power plant reactor core. Neutrino scatterings are detected with a special low-threshold, low-background germanium detector. With systems of active and passive shielding from background radiation, a low level of background in the region of searching for rare events is achieved. Registration of the searched events allows the search for New Physics beyond the Standard Model, in addition it can also have a practical usage, for example, in the development of new-generation detectors for monitoring the operation of a nuclear reactor using the antineutrino flux.

The RICOCHET is a new generation of reactor neutrinos experiments. The RICOCHET detectors are designed to provide the one percent precision measurement of Coherent Elastic Neutrino(n)-Nucleus Scattering (CEνNS) in the sub-100 eV energy region (i.e. under total coherency condition) to search for New Physics in the electroweak sector. It is planned to be installed until the end of 2023 at the Laue Langevin Institute (ILL) near the research nuclear reactor. The RICOCHET will host two cryogenic detector arrays: the CRYOCUBE (Ge target, based on EDELWEISS developed detector-bolometers) and the Q-ARRAY (Zn target).

Expected results upon completion of the project:
The main goals of the DANSS experiment are to test with reactor antineutrinos the hypothesis of oscillations into a sterile state and to monitor nuclear reactor operation by measuring the antineutrino flux. In few years it is planned to make a new upgraded setup DANSS-2. The aims of the upgrade are to improve energy resolution and increase detection volume, thus the sensitivity to sterile neutrinos will be significantly higher. The search for oscillations into the light ($\Delta m_{14}^2 \sim 0.1$-10 eV) sterile neutrino is one of the current trends in fundamental neutrino physics. The existence of a sterile neutrino could explain several observed contradictory results, first of all, the reactor and gallium (anti)neutrino anomalies, and at the same time become a revolutionary discovery of New Physics. Reactor experiments on a short baseline (<30 m) have several competitive advantages in this area of research: a giant antineutrino flux from the most intense available artificial sources of (anti)neutrinos on Earth and a small distance from the radiation source, where the oscillation pattern is not yet smeared. It should be noted that the DANSS spectrometer is the leading one for experiments of this type.

As a result of the project, it is expected to detect for the first time the coherent antineutrino scattering from the reactor and to improve the sensitivity of the neutrino magnetic moment detection to $(5\text{-}9)\times10^{-12}\ m_B$ after several years of measurements, which will greatly improve the current best limit.

In the RICOCHET experiment the statistical significance of CEνNS detection, after only one reactor cycle, should be between 4.6 and 13.6 σ, depending on the effectiveness of the muon veto. After about 10 reactor cycles, i.e. 3-5 years onsite, the targeted ~1% precision measurement (not including signal systematics) will be obtained, which will lead to orders of magnitude improved sensitivities to various New Physics scenarios compared to the existing experiments.

Expected results of the project in the current year:
DANSS: Data taking with the current DANSS setup, data analysis. New improved results of oscillation analysis. R&D for DANSS-2. Production, assembly at KNPP and commissioning of DANSS-2.

νGeN: Data taking in the current configuration of the setup. Simultaneous R&D for its upgrade, which will include a new internal veto, upgrade of the lifting platform, and reconfiguration of the muon veto system. New results for the neutrino magnetic moment and coherent scattering.

Ricochet: commission at ILL. Start of the data taking with germanium bolometers. R&D for new detectors. Improved MC model based on experimental data.

3. Nuclear spectrometry for the search and investigation of rare phenomena

Brief annotation and scientific rationale:
The project consists of five main experiments: LEGEND (The Large Enriched Germanium Experiment for Neutrinoless double beta Decay), TGV (Telescope Germanium Vertical), SuperNEMO (Neutrino Ettore Majorana Observatory), MONUMENT (Muon Ordinary capture for the NUclear Matrix elemENTs) and EDELWEISS (Expérience pour DEtecter Les WIMPs En Site Souterrain). The first four experiments solve the problems of searching and studying neutrinoless double beta decay. The EDELWEISS experiment aims to search for Dark Matter particles.

Expected results upon completion of the project:
The LEGEND experiment is designed to search for neutrinoless double beta ($0\nu\beta\beta$) decay of ^{76}Ge. In the experiment, germanium detectors fabricated from isotopically enriched material will operate inside a cryogenic fluid shield (liquid argon). The experiment will probe the $0\nu\beta\beta$ decay of ^{76}Ge with a sensitivity of $> 10^{28}$ years at the 90% confidence level.
The physics programme of the SuperNEMO Demonstrator Module consists of precision measurements of the $2\nu\beta\beta$ decay mode to constrain nuclear and BSM physics, as well as the best limits on $0\nu\beta\beta$, for the isotope ^{82}Se.

The purpose of the MONUMENT is to carrying out experimental measurements of muon capture at several daughter candidates for $0\nu\beta\beta$ decay nuclei.

The unlimited goal of current R&D and measurements in the EDELWEISS experiment is achievement of sensitivity allowing detection of B-8 solar neutrinos through coherent elastic neutrino-nucleus scattering. The project is in the transformation phase, when the old setup used from 2005 start to be decommissioned with the aim to have a lower-level background setup with a new-generation cryosystem which will allow timely fulfillmen of the intensive R&D program and Dark Matter search in the regions inaccessible by Ar/Xe experiments.

The TGV spectrometer will be used for further investigations of ECEC decay of ^{106}Cd and ^{130}Ba. According of our estimation and theoretical predictions for these rare processes we hope to detect both decays in the direct experiment for the first time.

Expected results of the project in the current year:
Adding of newly produced detectors to LEGEND-200 to reach the final ^{76}Ge mass of 200 kg. Restart data taking. R&D for LEGEND-1000 hardware components (detector holders, ASICs, lock system, LAr instrumentation, etc.). Start production and acceptance of the new enriched Ge detectors and installation of the LEGEND-1000 facility at the host lab.

Calibration data taking with the SuperNEMO Demonstrator. First data for $0\nu\beta\beta$ - and $2\nu\beta\beta$ - ^{82}Se. Completion of the data taking with the SuperNEMO Demonstrator in a configuration without passive protection. Installation of passive shielding of the detector (borated paraffin + borated water + low background iron) and installation of the anti-radon tent.

The MONUMENT programme will include preparation of new experiments at the PSI site. The appropriate R&D at Dubna concerns detectors, targets, calibrations and MC. Measurements of muon capture with titanium 48 and with gas targets of carbon enriched in atomic masses 12 and 13 at PSI; investigation of light nuclei in terms of validation of theoretical models applicable to double beta decay as well as enriched ^{96}Mo; data analysis. R&D on application of muon capture in other areas related to physics, such as radiobiology and mesochemistry.

The current EDELWEISS setup will be completely decommissioned at the LSM site. Commissioning of the BINGO setup and integration of new EDELWEISS detectors into the setup as continuation of the synergy between EDELWEISS and CupidMo collaborations. R&D to search for the nature of the heat only events in the bolometers. Simultaneous search for light Dark Matter candidates.

Upgrade of the TGV spectrometer (both detectors and electronics). Measurement of enriched ^{106}Cd.

N. Kučerka

Deputy: K.Z. Mamatkulov

Participating countries and international organizations:
Armenia, Belarus, Cuba, Egypt, India, Kazakhstan, Russia, Serbia, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:
Fundamental and applied studies of low-dimensional materials (2D materials and van der Waals heterostructures) using Raman spectroscopy and upconversion luminescence. Fluorescence microscopy and vibrational spectroscopy in studies of photo-activated programmed cell death (netosis and apaptosis). Spectroscopy of lipid-protein interactions and secondary structure of proteins. Mastering low-frequency Raman spectroscopy.

Brief annotation and scientific rationale:
Since the exfoliation of graphene in 2004, two-dimensional materials (2DMs) have attracted much attention due to the qualitative changes in their physical and chemical properties due to quantum size effect associated with their nanoscale thicknesses. Atomically thin two-dimensional transition metal dichalcogenides (TMDCs), such as MoS_2, WSe_2, and others, exhibit strong light-matter coupling, making them potentially interesting candidates for various applications in electronics, optics, and optoelectronics. They can be assembled to form heterostructures and combine the unique properties of their constituent monolayers. Raman spectroscopy is one of the most non-destructive and relatively fast technique for characterizing such materials, providing high spectral resolution. Vibrational frequencies in the Raman spectrum of low-dimensional materials exhibit characteristic features of the sample, including line shape, peak position, spectral width, and intensity. These parameters provide useful information about the physical, chemical, electronic, and transport properties of such materials.

Optical research methods are also very promising in Life Sciences. In particular, combining vibrational spectroscopy with fluorescence microscopy will allow a detailed study of the mechanisms and signalling pathways of photo-activated programmed cell death– NETosis. Raman spectroscopy is also a subtle tool in revealing the secondary structure of proteins and is sensitive to lipid-protein interactions.

Expected results upon completion of the project:
1. Measurement and characterization of the transport properties of 2DMs and vdWHs depending on the excitation photon energy.
2. Mechanism of Raman enhancement effects from analyte molecules adsorbed on two-dimensional materials. Study of their protective properties applied to biomolecules.

3. Up-conversion luminescence on a low-dimensional platform: studies depending on the sample, temperature and excitation wavelength.
4. Spectroscopic analysis of conformational transformations in the secondary structure of proteins present in various membrane mimetics, including, temperature, pH, and additives dependance.
5. Simulation of lipid-protein interaction by MD and DFT.
6. Identification of the mechanisms and signaling pathways of photoinduced NETosis by UV, visible and IR radiation. Identification of primary acceptors of photo-induced NETosis.
7. Characterization of the effects of simultaneous and sequential exposure to laser radiation on intact neutrophil cells at two different wavelengths.
8. Raman spectroscopy of ultra-low frequencies ~ 10 cm^{-1} at different wavelengths of excitation of the Raman signal.

Expected results of the project in the current year:

1. Measurements and analysis of Raman spectra of graphene, molybdenum disulfide, and van der Waals heterostructures based on them.
2. Initiation of studies of transport properties of low-dimensional materials depending on the laser excitation photon energy.
3. Detailing of protein secondary structure in membrane mimetics by Raman spectroscopy; modeling by methods of molecular dynamics and density functional theory.
4. Identification of primary photoacceptors of photoinduced netosis NETosis.

Brief annotation and scientific rationale:
The aim of the research is to study the molecular, genetic and organismal effects of ionizing radiation with different physical characteristics. The use of ionizing radiation of a wide range of linear energy transfer in radiobiological experiments allows obtaining unique information on the nature of the damage to the DNA structure of cells after irradiation, the mechanisms of the induction of gene and structural mutations in cells with different levels of genome organization, and the action of particle radiation on tumor during radiation therapy. Within the framework of the Theme, fundamental and applied problems of modern radiation biology will be addressed: the formation and repair of cluster DNA damage in normal and tumor cells following exposure to accelerated charged particles; the study of the radiosensitizing effect of the DNA repair modifier AraC in combination with various molecular biological complexes during irradiation of tumor cells and tissues; the study of the induction of gene and structural mutations in normal and tumor cells following exposure to charged particles; investigation of acute and long-term morphological and functional changes in the mammalian central nervous system following exposure to radiation with different physical characteristics.

When organizing radiobiological experiments with charged particle beams, it is extremely important to improve physico-dosimetric complexes, provide precision dosimetry, and conduct computer simulation of radiation-induced effects. In this regard, the urgent tasks are: the need for experimental modeling of the energy and spectral composition of cosmic and other types of ionizing radiation; the search for methods for non-destructive analysis of unique samples; and automated processing of biological experiment data. In the course of the research, it is planned to develop new setups and dosimetry systems for irradiating biological samples; introduce methods for non-destructive analysis of unique samples, develop and test systems for automated computer processing of biological data; formulate new mathematical models and computational approaches for radiobiology, bioinformatics and radiation medicine; and identify mechanisms and pathways of catalytic synthesis of prebiotic compounds under the action of radiation.

Expected results upon completion of the project:

1. To study clustered DNA DSB formation after exposure to accelerated charged particles of different energies in the nuclei of human skin fibroblasts, tumor cells, and neurons of different parts of the central nervous system of irradiated animals.
2. To study the repair kinetics of clustered DNA DSB in the post-irradiation period in the nuclei of human skin fibroblasts and radioresistant tumor cells.
3. To study mechanisms of the radiosensitizing effect of cytosine arabinoside in combination with various molecular biological complexes on normal and tumor cells after exposure to radiation with different LET.
4. To study quantitatively the survival of normal and tumor cells after radiation exposure in the presence of a combination of DNA repair modifiers.
5. To continue investigation of point and structural mutation induction in *Saccharomyces cerevisiae* yeast cells by radiation with different LET.
6. To study the influence of heterogeneity of cell population in haploid yeast on the radiation-induced mutagenesis; estimate mutagenesis in different phases of cell cycle.
7. To study the influence of respiratory impairment as the result of mitochondrial DNA damage on the sensitivity to the mutagenic effect of radiation.
8. To study the mechanism of radioresistance and its effect on radiation-induced mutagenesis in yeast mutants.
9. To continue the study of radiation-induced mutagenesis and to compare the yield of chromosomal aberrations in Chinese hamster cells at the highest and lowest mutagenesis levels depending on the time of expression and LET of accelerated ions.
10. To analyse structural disorders in the *hprt* gene and their projection on disorders in the chromosome machinery of cells.
11. To finalise the mFISH study of the biological effectiveness of proton beams.
12. To study the biological effectiveness of low-energy X-rays following *in vitro* irradiation of human blood lymphocytes using the mFISH method.
13. To evaluate the contribution of complex chromosome aberrations to the biological effectiveness of densely ionizing radiations following irradiation of human normal and tumour cells *in vitro.*
14. To study the induction and kinetics of chromatin break repair by premature chromatin condensation in normal and tumour human cells exposed to sparsely and densely ionizing radiation.
15. To continue the study of primary and late morphological and functional changes in the central nervous system of rats following exposure to ionizing radiation with different physical characteristics.
16. To conduct studies of pharmacological protection agents' action under ionizing radiation exposure.
17. To continue the investigation of the activation of microglial cells in cell culture and inflammatory markers in the brain of mice following exposure to ionizing radiation of different quality.
18. To investigate the possibility to modulate the activation of microglial cells in irradiated culture and neuroinflammation in the brain of irradiated mice by using inhibitors to the receptors of signalling pathways involved in these processes.
19. To study *in vivo* the radiosensitizing effect of cytosine arabinoside in combination with other molecular biological complexes on melanoma tumor growth in mice following the combined exposure to these agents and proton radiation.
20. To evaluate the influence of the combined action of AraC and other molecular biological complexes on the survival of different normal and tumor cell lines based on clonogenic survival criterion upon X-ray and proton irradiation.
21. To study the kinetics of the formation and elimination of DNA damage in U87 glioblastoma and other radioresistant cell cultures after proton and X-ray exposure in the presence of AraC and other molecular biological complexes.
22. To study DNA DSB formation in different components of the central nervous system after *in vivo* irradiation with protons and X-rays in the presence of a combination of radiomodifiers.

Expected results of the project in the current year:

1. To continue the analysis of the formation and repair of clustered DNA double-strand breaks after exposure to accelerated charged particles and photon radiation in the nuclei of human fibroblasts, tumor cells (U87, B16), and neurons of different parts of the central nervous system (CNS) of animals.
2. To continue the analysis of the formation and structure of complex clustered DNA lesions by immunocytochemical staining of repair proteins γH2AX, 53BP1, OGG1, and XRCC1 in human fibroblast nuclei and tumor cells (U87, B16) after exposure to accelerated charged particles and photon radiation.
3. To continue studying apoptosis induction in human skin fibroblasts, tumor cells (U87, B16), and mammalian CNS neurons after exposure to accelerated charged particles and photon radiation.
4. To study mechanisms of the radiosensitizing effect of cytosine arabinoside (AraC) in combination with various molecular biological complexes on the survival of, and the formation and elimination of DNA damage in, normal and tumor cells *in vivo* and *in vitro* after exposure to accelerated charged particles and photon radiation.
5. To continue research on the induction of structural rearrangements in yeast cells by radiation with different LET.
6. To study the influence of yeast cell population heterogeneity on the sensitivity to the lethal and mutagenic effects of ionizing radiation.
7. To study the effect of different repair pathways on radiation-induced mutagenesis in lower eukaryotes.
8. To continue studying the effect of mitochondrial DNA damage on radiosensitivity and mutagenesis in unicellular eukaryotes.
9. To continue the analysis of chromosomal aberrations detected in radiation-induced mutants in the long term after irradiation of a mammalian cell culture.
10. To compare the yield of structural abnormalities and the level of HPRT mutagenesis in V79 Chinese hamster cells after exposure to ionizing radiation with different physical characteristics.
11. To continue the metaphase and mFISH analysis of chromosomal aberrations induced in peripheral blood lymphocytes of monkeys *(Macaca mulatta)* by ionizing radiation with different physical characteristics.
12. To continue the mFISH study of the induction of complex aberrations in human normal and tumor cells by ionizing radiation with different physical characteristics.
13. To continue the study of long-term memory and learning disorders in rats in the Morris test after whole-body proton irradiation.
14. To study demyelination and morphological changes in the CNS of rats after whole-body proton irradiation.
15. To develop a method for assessing radiation-induced cell death in intestinal crypts and conduct pilot experiments with X-rays alone and in combination with AraC.
16. To study the electroencephalogram, behavioral reactions, and morphological changes after local irradiation of the brain of laboratory animals at the SARRP facility.
17. To carry out pilot experiments on computer tomography and local X-ray irradiation of tumors in laboratory animals at the SARRP facility.
18. To develop a method for the evaluation of AraC and other radiomodifiers' content in blood plasma, tissues, and tumors of laboratory animals using liquid chromatography in order to study the pharmacokinetics and metabolism of these compounds.

Brief annotation and scientific rationale:
A wide range of JINR's ionizing radiation sources, especially heavy ion beams of various energies, offer a unique opportunity to solve a number of fundamental problems of radiobiology and astrobiology, as well as practical problems related to space exploration and the development of radiation medicine.

Due to the high complexity and cost of performing biological experiments at accelerator complexes, it is of paramount importance to improve experimental methods, ensure dosimetry and radiation safety, and perform relevant computer simulations. The most pressing issues here are the need for experimental reproduction of the energy and spectral composition of cosmic and other types of ionizing radiation, the search for methods for non-destructive analysis of unique samples and automated processing of biological experiment data, as well as the high complexity and resource intensity of computer simulation of processes in living systems.

This project is aimed at solving a complex of the above problems arising in radiobiological and astrobiological research. In the course of its implementation, it is planned to develop new stations for irradiation and dosimetry systems; introduce methods for non-destructive analysis of unique samples; develop and test systems for automated computer processing of biological data; formulate new mathematical models and computational approaches for radiobiology, bioinformatics, and radiation medicine; and identify mechanisms and pathways of the catalytic synthesis of prebiotic compounds under radiation exposure.

Expected results upon completion of the project:
1. Provision of dosimetry and irradiation of biological samples at JINR accelerators.
2. Upgrade and commissioning of the Genome-3 facility.
3. Development of a multimodal tomography system for small laboratory animals.
4. Equipping a room for radiobiological experiments using radionuclides.
5. Creation of a prototype space radiation simulator.
6. Development and testing of instruments for neutron dosimetry and spectrometry.
7. Development of an information system for working with experimental data in the form of two-dimensional images, computed tomography data, and video recordings.
8. Development of protocols for labeling two-dimensional images and video materials, formation of a labeled database.
9. Testing the implemented analysis algorithms; development and registration of software designed for automated data processing.
10. Development of mathematical models of the formation and repair of various types of DNA damage and models of the formation of mutations and chromosomal aberrations.
11. Molecular dynamics modeling of structural and functional disorders in mutant and oxidized forms of proteins.
12. Development of mathematical models of radiation-induced death of tumor cells and prediction of tumor growth for promising radiation therapy methods.
13. Theoretical evaluation of radiation-induced disorders of the CNS on the basis of mathematical models of brain neural networks, taking into account damage to synaptic receptors, oxidative stress, and impaired neurogenesis and gliogenesis.
14. Study of possible pathways of, and conditions for, the formation of prebiotic compounds by irradiation of cosmic matter or terrestrial rocks in combination with the simplest organic molecules.
15. Search for and structural analysis of microfossils and organic compounds in various meteorites by nuclear physics methods.

Expected results of the project in the current year:

1. To perform mathematical modeling of DNA damage formation and repair kinetics in different phases of the cell cycle after exposure of mammalian normal and tumor cells to accelerated heavy charged particles of different energies.
2. To continue mathematical modeling of tumor cell population dynamics after exposure to ionizing radiation in the presence of DNA synthesis inhibitors.
3. To continue molecular dynamics modeling of violations of the structure and functions of synaptic receptor proteins and, as a result, the behavior of the neural network of the central nervous system (CNS).
4. To continue mathematical modeling of radiation-induced disorders of neurogenesis and gliogenesis and neuroinflammatory processes in CNS structures.
5. To continue mathematical modeling of the induction of chromosomal aberrations in mammalian and human cells by ionizing radiation with different characteristics.
6. To apply computer vision algorithms to biological data processing, histology, and behavioral experiments.
7. To ensure that radiobiological experiments are carried out at the LRB's X-ray facilities (SARRP, CellRad).
8. To take part in the design and construction of the Genome-3 station at applied beams of the U400M cyclotron.
9. To take part in a model calculation of the radiation fields of the NICA complex in order to provide the radiation protection of personnel.
10. Together with the JINR Department of Radiation Safety, to take part in forecasting the radiation environment and studying the radiation fields of the NICA accelerator complex using the Bonner sphere method during commissioning.
11. To take part in the design and construction of the SIMBO station at the ARIADNA applied beams of the NICA complex.
12. To develop a prototype of a new neutron dosimeter for a wide energy range.
13. To expand the collection of samples of terrestrial rocks and meteorites.
14. To compare the mineral composition of terrestrial rocks and carbonaceous chondrites using SEM.
15. To conduct an elemental analysis of terrestrial biological samples and fossils of different geological periods.
16. To classify and systemize microfossil samples in carbonaceous chondrites.
17. To formulate the problems of terrestrial contamination of meteorites.
18. To analyze the results of experiments on the synthesis of prebiotic compounds from formamide.

Study of molecular genetic mechanisms of adaptations of extremophilic organisms

Theme leader: E.V. Kravchenko

Participating countries and international organizations:
Egypt, Moldova.

The problem under study and the main purpose of the research:
Study of the mechanisms of adaptation of extremophilic organisms to physical and chemical stresses and their use for the protection of other organisms.

Projects in the theme:

	Name of the project	Project Leader	Project code
1.	Protection Against Physical and Chemical Stresses with Tardigrade Proteins (TARDISS)	E.V. Kravchenko	05-2-1132-1-2021/2028

Project:

	Name of the project	Project Leader	Status
	Laboratory (Subdivision)	Responsible from laboratories	
1.	**Protection Against Physical and Chemical Stresses with Tardigrade Proteins (TARDISS)**	**E.V. Kravchenko**	Implementation
	DLNP	T.O. Azorskaya, O.A. Kuldoshina, A.V. Rzyanina, R.A. Tarasov, A.S. Yakhnenko, M.P. Zarubin	
	FLNR	T.N. Murugova	

Brief annotation and scientific rationale:
Mechanisms of adaptation of living organisms to existence in extreme conditions are of great interest for applied and fundamental research, in particular, mechanisms of resistance to ionizing radiation, high mineralization of the environment, effects of heavy metals, high and low temperatures and high pressure. Under the conditions of increasing level of radiation background due to various man-made components, the problem of cosmic radiation, which prevents the long stay of living organisms in space, the need to protect healthy tissues from radiation during radiation therapy of tumour, and a number of general mechanisms underlying cell aging and their damage by ionizing radiation, the study of new mechanisms for increasing radioresistance is one of the most important areas of molecular biology and radiobiology.

Representatives of Tardigrada (tardigrades) belong to the group of animals most resistant to various types of stress on Earth. Tardigrades are able to survive after exposure to both rare and dense ionizing radiation at doses of about 5 kGy.

The Dsup protein is a new protein discovered in 2016 in the tardigrade *Ramazzottius varieornatus*, one of the most radioresistant species of multicellular organisms. Previously, we created *D. melanogaster* lines and HEK293 human cell culture expressing this protein, for which a significant increase in radioresistance was shown when exposed to various types of ionizing radiation. For *D. melanogaster* lines expressing Dsup, the transcriptomic analysis was performed, which revealed the effect of the Dsup protein on a number of processes at the cellular and organism levels. Our results were published in 2023 in iScience (Q1) (https://doi.org/10.1016/j.isci.2023.106998). In the course of the experiments to determine the structure of the Dsup protein, the physical dimensions of the Dsup protein molecule were estimated for the first time, some parameters of the DNA-Dsup complex were established, and the existence of a possible secondary structure of the Dsup protein was shown.

The problems to be solved during the implementation of the project are new and important not only for fundamental molecular biology and radiobiology, but also for applied areas of biotechnology, space research and other disciplines that require an increase in the level of radioresistance of organisms.

Expected results upon completion of the project:

1. Creation of a regulated scheme for the expression of the gene encoding the Dsup protein in the *melanogaster* model object to develop a controlled system for the temporary increase in radioresistance of the whole organism.
2. Evaluation of the effect of the Dsup protein on chromatin compaction in cells to establish the fundamental characteristics of the Dsup protein and map new regulatory elements in the D. melanogaster genome.
3. Obtaining data on the stability and properties of the Dsup protein during exposure to high temperatures and ionizing radiation to evaluate the use of this protein in pharmacology and medicine as a cryoprotectant, preservative and stabilizer for vaccines and other DNA/RNA-containing drugs, and as a protective agent for radio- and chemotherapy.
4. Development of a technique and a material for purifying solutions from nucleic acids and concentrating DNA and RNA from various biological fluids using the Dsup protein.

Expected results of the project in the current year:

1. Creation of a D. melanogaster line expressing Dsup under the control of the promoter of the metallothionein gene and assessing the basal level of Dsup transcription and the transcription level in the case of promoter induction with different concentrations of copper compounds.
2. By using the methods SAXS, DLS, circular dichroism (FLNP JINR, Moscow Institute of Physics and Technology), characterization of the Dsup protein structure after its irradiation with gamma quanta at doses of 2-10 kGy or heating at 60-100^{0}C.

Methods, Algorithms and Software for Modeling Physical Systems, Mathematical Processing and Analysis of Experimental Data

Theme leaders: S.V. Shmatov
O. Chuluunbaatar

Deputies: N.N. Voytishin
P.V. Zrelov

Participating countries and international organizations:
Armenia, Belarus, Bulgaria, CERN, China, Egypt, France, Georgia, Italy, Kazakhstan, Mexico, Mongolia, Russia, Serbia, Slovakia, South Africa, United Kingdom, USA, Uzbekistan.

The problem under study and the main purpose of the research:
The theme is aimed at organizing and providing computational, algorithmic and software support for the preparation and implementation of experimental and theoretical research conducted with JINR's participation, at elaborating, developing and using computational methods for modelling complex physical systems studied within the projects of the JINR Topical Plan. Within the theme, mathematical methods and software, including those based on machine and deep learning algorithms using recurrent and convolutional neural networks, will be developed for modelling physical processes and experimental facilities, processing and analysing experimental data in the field of elementary particle physics, nuclear physics, neutrino physics, radiobiology, etc. Particular attention will be paid to the creation of systems for the distributed processing and analysis of experimental data, as well as information and computing platforms to support research conducted at JINR and other research centres.

The main directions of work are mathematical and computational physics to support JINR's large research infrastructure projects, primarily, the NICA flagship project in the fixed target mode (BM@N) and in the collider mode for relativistic heavy ion collisions (MPD) and polarized beams (SPD), the Baikal-GVD neutrino telescope. Cooperation with experiments at the world's accelerator centres (CERN, BNL, etc.), experiments in the field of neutrino physics and astrophysics, radiobiological research programmes will also be continued. The possibility of using the developed methods and algorithms within other projects is being considered. The major direction in modelling complex physical systems, including the states of dense nuclear matter and quantum systems, will be the development of methods, software packages and numerical research based on the solution of the corresponding systems of nonlinear, spatially multidimensional integral, integro-differential or differential equations in partial derivatives with a large number of parameters characterized by the presence of critical modes, bifurcations and phase transitions with the complex application of methods of computational physics, quantum information theory and hybrid quantum-classical programming methods.

Within the theme, it is also planned to develop work on the quantum intelligent control of technological processes and physical facilities at JINR, as well as quantum computing in quantum chemistry and physics.

In addition, the training of specialists in the field of computational physics and information technology within the IT School will be continued.

Brief annotation and scientific rationale:

The project is aimed at organizing and providing computational support for physics research programmes implemented with JINR's participation, at developing mathematical methods and software for modelling physical processes and experimental facilities, processing and analysing experimental data in the field of elementary particle physics, nuclear physics, neutrino physics, condensed matter, radiobiology, etc. The particular attention will be paid to the creation of systems for the distributed processing and analysis of experimental data, as well as information and computing platforms to support research at JINR and other world centers.

The main areas of work are mathematical and computational physics to support JINR's large research infrastructure projects, first of all, the experiments at the NICA accelerator complex and the Baikal-GVD neutrino telescope. Further cooperation with experiments at the largest world accelerator centers (CERN, BNL, etc.), experiments in the field of neutrino physics and astrophysics, radiobiological research programmers will also be continued. The possibility of using the developed methods and algorithms within other megascience projects is being considered.

Expected results upon completion of the project:

1. Revision of interaction generators and their development for modelling the processes of interactions of light and heavy nuclei, including those at NICA energies (FTF, QGSM, DCM-QGSM-SMM, etc.), and processes beyond the Standard Model, such as the production of candidate particles for the role of dark matter, additional Higgs bosons and processes that violate the

lepton number, etc. (QBH, Pythia, MadGraph, etc.) for LHC conditions at a nominal energy and a total integrated luminosity up to 450 fb^{-1}.

2. Development of algorithms for the reconstruction of charged particle tracks for experimental facilities, including those at NICA and the LHC, creation of appropriate software and its application for data processing and analysis, the study of the physical and technical characteristics of detector systems.
3. Development of scalable algorithms and software for processing multi-parameter, multi-dimensional, hierarchical data sets of exabyte volume, including those based on recurrent and convolutional neural networks, for machine and deep learning tasks, designed primarily for solving various problems in particle physics experiments, including for the NICA megaproject and neutrino experiments.
4. Creation and development of data processing and analysis systems and modern research tools for international collaborations (NICA, JINR neutrino programme, experiments at the LHC).
5. Development of algorithms and software for JINR's research projects in the field of neutron physics.
6. Development of algorithms, software and computing platforms for radiobiological research, applied research in the field of proton therapy and ecology.

Expected results of the project in the current year:

1. Revision of FTF and QGSM models and development of software modules for modelling nuclear interactions of charmed hadrons, light hyper-nuclei.
2. Development of the DCM-QGSM-SMM generator: considering the dependence of the lifetime of resonances on the density of the nuclear medium, the suppression of the production cross section of pseudoscalar mesons, and the enhancement of the production of hyperons in a dense nuclear medium, including the deformation of nuclei.
3. Development of software for simulating the events indicated in the previous paragraph, taking into account the performance of the NICA SPD facility.
4. Evaluation of cross sections and modelling of the processes of production of dark matter particles within extended two-doublet Higgs models (MadGraph generator).
5. Debugging the procedure for testing sensitive elements of the high-granularity calorimeter of the CMS experiment, including track reconstruction and the evaluation of the efficiency of each detector cell.
6. Development and adjustment of algorithms and methods for reconstructing muon trajectories in the Cathode-Strip Chambers (CSCs) of the muon system of the CMS experiment for the comparison of the continuous and discrete approaches of wavelet analysis for separating overlapping signals; estimation of the CSC spatial resolution and the aging effect on data obtained in 2024 at the GIF++ facility at CERN and in proton-proton beam collisions at the LHC.
7. Optimization of algorithms for local track reconstruction in the DCH and CSC detectors of the BM@N experiment, their fitting with scintillation detectors for global reconstruction and particle identification, detector alignment and estimation of their operation parameters with experimental data of 2022–2023.
8. Finding and checking correction parameters for the CSC and GEM detectors of the BM@N experiment, development and implementation of software for modelling and data processing methods, as well as their development and adaptation for the current configurations of a number of GEM and Silicon Profilometer tracking detectors in 2023–2024.
9. Study of the effectiveness of the application of machine learning methods based on decision trees for the particle identification task in the MPD experiment.
10. Optimization of the software platform of the MPD experiment: development and implementation in MPDRoot on the basic rules of OOP, unified tests of algorithms and interaction of classes, etc..
11. Development and training of a neural network for searching and restoring tracks in the vertex detector and tracker of the SPD facility, for restoring clusters in the electromagnetic calorimeter and in the SPD muon system.
12. Development of a data processing and storage model: specification of data types and formats, estimation of computational costs for processing at each stage of data transformation, formulation of technical requirements for a real-time data selection system, a distributed data processing and storage system, and offline processing software.

13. Creation of a prototype of a system that provides multi-stage data processing on a real-time event filtering cluster, SPD OnLine Filter.

14. Creation of prototypes of the SPD task management system based on the PanDA package and the data management system based on the RUCIO DDM package.

15. Development of a prototype system for data processing for the Baikal telescope.

16. Development of a test package for the primary processing of small-angle experimental data from the YuMO spectrometer for a multi-detector system with a position-sensitive detector.

17. Development of a C++ library for converting online condition data into JSON, implementation of DCS data conversion to CREST. Modification of Athena package algorithms using COOL for CREST. Development and maintenance of the operation of information systems for the BM@N and MPD experiments to describe the geometry of facilities, configuration of detectors, management process.

18. Study of the background from cosmic protons for the TAIGA observatory, estimation of the number of evaporation neutrons and investigation of their interaction in the OLVE-HERO detector.

19. Analysis of test data from the prototype of a digital calorimeter for proton therapy, development of an algorithm based on a cellular automaton for track recognition and reconstruction.

20. Application of piecewise polynomial approximation based on the high-order basis element method for processing and analysing neutron noise from the IBR-2M reactor.

21. Development of a behavioral analysis module that will automate the analysis of video data obtained during the testing of laboratory animals in various test systems.

22. Application of algorithms for the automatic selection of optimal data augmentation policies, testing of various loss minimization functions, determination of the most effective methods for classifying images with plant diseases.

23. Improving the existing functionality and providing new opportunities for monitoring and predicting the state of the environment. Automation of the monitoring process using simulation.

Brief annotation and scientific rationale:
The project is aimed at the development and application of mathematical and computational methods for modelling complex physical systems studied within the JINR Topical Plan and described by systems of dynamic nonlinear, spatially multidimensional integral, integro-differential or differential equations that depend on the parameters of models. The evolution of solutions to such systems can be characterized by the occurrence of critical modes, bifurcations and phase transitions. Mathematical modelling is an inseparable part of modern scientific research. It entails an adequate mathematical formulation of problems within the models under study, the adaptation of known numerical approaches or elaboration of new ones to effectively take into account the features of the studied physical processes, the development of algorithms and software packages for high-performance simulation on modern computer systems, including the resources of the JINR Multifunctional Information and Computing Complex.

Expected results upon completion of the project:
1. Development of methods, algorithms and software packages for conducting the numerical research of interactions of various types in complex systems of nuclear physics and quantum mechanics.
2. Methods for modelling multifactorial processes in materials and condensed matter under external actions.
3. Methods for solving simulation tasks in the design of experimental facilities and the optimization of their operating modes.
4. Methods for modelling complex processes in dense nuclear matter based on the equation of state.

   Methods for modelling quantum systems using quantum information theory methods and hybrid quantum-classical programming methods.

Expected results of the project in the current year:
1. Development of a mathematical formulation of the problem within the strong coupling channels method with the Woods–Saxon optical potential and regular boundary conditions for modelling sub-barrier heavy ion fusion and fission reactions.
2. Development of methods and calculation of the energy of adsorption on the Au layer of heavy and superheavy atoms.
3. Development and optimization of the method of self-similar approximations for solving nonlinear equations that do not contain small parameters and describe quantum mechanical systems, including spin ensembles and cold atoms in traps.
4. Development of a method and a programme that initiates, within the transport-statistical approach, the initial state of colliding nuclei with nuclear potentials, which are used for further calculations in collision dynamics.
5. Modelling of proton-nucleus interactions, based on a microscopic model of the optical potential, over a wide range of energies and for a large variety of atomic numbers of target nuclei with the aim at assessing the influence of the nuclear medium on the processes of proton scattering by intranuclear nucleons.
6. Investigation of the dynamics of a shock wave in an irradiated material based on a model described by the combination of molecular dynamic equations, thermal conductivity equations and wave equations. Determination of the parameters of the wave equation based on the results of the numerical solution of molecular dynamics equations.
7. Simulation of the interaction of amyloid beta and antimicrobial peptides with phospholipid membranes in vesicular and bicellar structures in the coarse-grained model; study of the dynamic properties of this interaction based on the calculation of the phonon spectra of systems; construction of the free energy profile of the process of pulling the peptide out of the membrane depending on the distance between the centers of mass and the conformation of the peptide (replica exchange umbrella sampling).
8. Study of localized structures in systems described by nonlinear damped-driven equations. Investigation of the formation of a hydrated electron based on a modified polaron model that takes into account the Coulomb interaction, calculation of the observed characteristics of this process.
9. Adaptation of the COMSOL Multiphysics® package to the HybriLIT heterogeneous platform in order to enhance the efficiency of computations and reduce the computational time through the use of a mixed vector-scalar formulation of magnetostatics and a hybrid finite and boundary element method. Development and software implementation of difference

schemes for solving a boundary value problem for a 4^{th} order equation describing the distribution of physical fields in 2D and 3D regions of various configurations.

10. Development of methods and study of the formation of magnetic fields of isochronous cyclotrons under various operating modes. Preparation of instructions and registration of the CORD (Closed ORbit Dynamics) programme in the JINRLIB library. CORD implements calculations to study the effect of betatron oscillations and the phase motion of beam particles on the magnetic field of the MSC230 cyclotron.

11. Adaptation of the neural network approach to the approximate calculation of multiple integrals arising in the study of pion survival in heavy ion collisions; elaboration of methods aimed at extending to finite temperatures the previously developed model of the quark-hadron phase transition in cold nuclear matter.

12. Modelling and calculation of cosmological redshift values based on the equation of state; investigation of the possibility of reconstructing the mass spectrum of an isolated neutron star from the data on the age and surface temperature of pulsars, based on simulations of their temperature evolution; simulation of the processes of scattering and production of particles in dense and hot nuclear matter.

13. Development of an evolution operator trotterization algorithm for von Neumann and Lindblad equations and implementation of the corresponding quantum circuit on a quantum simulator in the QISKit environment. Improving the performance of the quantum circuit simulator by increasing the simulation speed using multiprocessing.

14. Creation of a package of modules designed to decompose a quantum system into subsystems based on the use of the tensor products of representations of wreath products of finite cyclic groups.

15. Determination of the relationship between the characteristics of the entanglement of composite quantum systems and the negativity of Wigner quasiprobability distributions. Development of a functional reduction method for two-loop Feynman integrals and its application to the calculation of integrals corresponding to diagrams with four and five external lines.

Activities:

	Name of the activity:	**Leaders**	**Implementation period**
	Laboratory (Subdivision)	Responsible from laboratories	
1.	**Intelligent control of technological processes and physical equipment's in JINR and quantum computing in quantum chemistry and physics**	**P.V. Zrelov** **S.V. Ulyanov**	2024-2026
	MLIT	D.A. Baranov, O.V. Ivantsova, M.S. Katulin, E.A. Kuznetsov, A.G. Reshetnikov, A.R. Ryabov, N.V. Ryabov, L.A. Syurakshina, D.P. Zrelova	
	VBLHEP	Yu.G. Bespalov, O.I. Brovko, D.N. Nikiforov, G.P. Reshetnikov	
	BLTP	V.Yu. Yushankhai	

Brief annotation and scientific rationale:

The main addressed issues of the activity are the development and effective application of intelligent computing technologies and the quantum self-organization of inaccurate knowledge in robust control tasks in order to enhance the reliability of the functioning of physical facilities. The solution of the tasks is based on the possibility of increasing the robustness of existing control systems through embedded knowledge bases. Self-organized control systems are designed and supported by software tools developed in the project on the basis of a platform that combines soft computing and quantum knowledge base optimizers. Embedded self-organized controllers will be developed for systems of the intelligent control of JINR's technological processes, devices and facilities (including for cases of unforeseen and unpredictable situations) and intelligent cognitive robotics tasks.

The investigation of the effectiveness of quantum algorithms is aimed at solving the tasks of quantum chemistry and physics of new functional materials. The application of well-known quantum algorithms and their development will be carried out on simulators of classical computing architecture. It is planned to create a software product for calculating the electronic and magnetic structures of molecular complexes and crystal fragments of new functional materials using quantum simulators on classical computing architectures.

Expected results upon completion of the activity:

1. Creation of a prototype of a quantum fuzzy PID controller and of a demonstration robot with a built-in controller prototype.
2. Creation of a prototype of an intelligent control system for cryogenic systems of superconducting magnets of the NICA accelerator complex on the basis of the quantum fuzzy PID controller. Preparing a patent.
3. Methodology of building and structure of an intelligent control system for a high-frequency station.
4. Verification of the effectiveness of quantum algorithms of variational type implemented on quantum simulators of classical architecture by applying them to the quantitative description of the dissociation of simple molecules, as well as the electronic and spin structure of the ground state of typical lattice models of quantum theory.

Expected results of the activity in the current year:

– creation of a prototype of a quantum fuzzy PID controller;

– creation of the structure of and development of a quantum fuzzy inference algorithm for a prototype of an intelligent control system for cryogenic systems of superconducting magnets of the NICA accelerator complex on the basis of the quantum fuzzy PID controller.

2.	**Training of specialists in the field of computational physics and information technology**	**V.V. Korenkov** **A.V. Nechaevsky** **D.I. Pryahina** **O.I. Streltsova**	2024-2026
	MLIT	T.Zh. Bezhanyan, O.Yu. Derenovskaya, E.Mazhitova, I.S. Pelevanyuk, A.S. Vorontsov, E.N. Voytishina, M.I. Zuev	
	UC	D.V. Kamanin, A.Yu. Verkheev	

Brief annotation and scientific rationale:

The training and retraining of specialists in computational physics and information technology on the basis of the Multifunctional Information and Computing Complex (MICC) of the Joint Institute for Nuclear Research (JINR) and its educational components are performed for:

– upskilling JINR staff members in order to develop scientific projects, including megascience ones, which are implemented at JINR or with its participation, as well as to create and support the JINR Digital EcoSystem (DES);

– disseminating competencies in computational physics and information technology to the regions of Russia and the JINR Member States to enhance the personnel potential of JINR and organizations cooperating with the Institute.

The main prerequisite for the creation of the activity is the necessity to form a research environment in order to ensure the professional growth of IT specialists, the creation and development of scientific groups, and the engagement of new specialists in JINR projects. The additional training of the personnel, mainly on request of the JINR Laboratories, should be aimed at developing special competencies, in-depth knowledge and practical skills in computational physics and information technology.

Expected results upon completion of the activity:

1. Holding events for JINR staff members to study state-of-the-art information technologies and opportunities to work on the MICC components and in the DES.
2. Forming a set of JINR projects in which students can participate.
3. Forming a list of competencies and required courses for the implementation of projects.
4. Elaboration of training courses and educational programmes that will provide personnel training for solving a variety of tasks within projects.
5. Creation of an ecosystem for the implementation of educational programmes on the basis of the JINR MICC, including the cloud infrastructure, the HybriLIT heterogeneous computing platform, which comprises the education and testing polygon and the “Govorun” supercomputer.
6. Creation of a software and information environment and a platform for organizing and holding events, lectures, workshops, hackathons, etc.
7. Involvement of specialists from JINR and JINR Information Centres, researchers from the JINR Member States’ organizations, lecturers from leading educational organizations that cooperate with JINR in order to hold educational and scientific events.
8. Forming event programmes and organizing interaction with universities and JINR Information Centres.

Expected results of the activity in the current year:

1. Holding events for JINR staff members (seminars for users of the JINR MICC and the DES).
2. Creation of an ecosystem component for the implementation of educational programmes.
3. Conducting JINR Schools of Information Technologies.
4. Conducting training practices for students of the Russian Federation and the JINR Member States.
5. Elaboration of training courses on information technology.

Applied Innovation Activities (07)

07-1-1107-2011

Applied research at NICA in radiation materials sciences, life sciences and new methods of energy production

Theme leaders: O.V. Belov
E.M. Syresin

Participating countries and international organizations:
Armenia, Belarus, Bulgaria, Mexico, Moldova, Russia, South Africa, Uzbekistan.

The problem under study and the main purpose of the research:
Obtaining applied research and technology results within the areas ARIADNA collaborations' activity, including life sciences, biomedical technologies, space research, radiation materials science, radiation hardeness of electronics, development of new technologies for ADS using NICA beams.

Project in the theme:

	Name of the project	Project Leaders	Project code
1.	Accelerator Driven Subcritical Reactor (ADSR)	S.I. Tyutyunnikov M. Paraipan	07-1-1107-1-2018/2027

Project:

	Name of the project Laboratory (Subdivision)	Project Leaders Responsible from laboratories	Status
1.	**Accelerator Driven Subcritical Reactor (ADSR)** VBLHEP, FLNP, DLNP, FLNR, BLTB, LRB	**S.I. Tyutyunnikov** **M. Paraipan** see list of activities	Realization

Brief annotation and scientific rationale:
The project is aimed to determine the optimum beam-converter combination meant to optimize the efficiency of an accelerator driven subcritical reactor. The planned research will be oriented in two directions. The first involves the comparative study of the fission distribution and the energy released in enriched fuel blanket, irradiated with proton beams with energy 0.2–2 GeV and ion beams with masses until ^{20}Ne and energies in the interval 0.2 – 1 AGeV. The second consists in measurements of the neutron yield from various converters, irradiated with proton and ion beams.

A possibility to realize a nuclear system with increased burning capabilities is to use an accelerator driven subcritical reactor (ADSR). It consists of a particle accelerator coupled with a nuclear reactor. The particle beam striking a converter placed in the central part of the reactor realizes a supplementary source of neutrons which allows the functioning of the reactor in subcritical regime (with criticality coefficient k_{eff} below 0.99), ensuring a safer exploitation of nuclear plants. The harder neutron spectrum obtained ensures a better incineration of the actinides.

In spite of the almost generalized opinion that the optimal beam for ADS is a proton beam with energy around 1–1.5 GeV we have shown in a series of works that ion beams have a superior energetic efficiency than protons. The activities within the project are oriented towards searching the conditions which maximize the energy efficiency of ADSR and ensure high burnup. Within the previous years, aspects related with the core geometry, the material used for the converter, the fuel composition, the working value of k_{eff}, the enrichment and power density distribution were investigated. The influence of the beam characteristics (particle type, energy, beam intensity), and of the accelerator type were also studied. The main conclusions obtained constitute the bases for extending the project in accordance with the stated objectives.

The proposed graphite target “GAMMA4” with fuel rods inserted inside and a central hole for the placement of different converters allows a correct comparison between the number of fissions and the energy released realized with proton and ion beams. The use of a graphite block instead of Pb gives the possibility to diminish the necessary amount of fissile material due to the softer neutron spectrum. Such target is easier to manipulate (due to its lower weight) and cheaper. The proposed graphite target “GAMMA4” is suitable for a comparative study of the efficiency of various beams in terms of the possibility of their use in ADS.

Expected results upon completion of the project:
1. Selection of on an optimal design of a target of the ADS;
2. Verification of a principally new concept of a system based on the use of ion beams instead of protons;

3. Implementation of the first stage of experimental programme focused on measurement of neutron yields with different converter combinations.

Expected results of the project in the current year:

1. Determination of the optimal target design for the ADS.
2. Obtaining simulation results on the optimal design of the target for ADS.

07-5-1131-2017

Radiation materials science, nanotechnological and biomedical investigations with heavy-ion beams

Theme leaders: S.N. Dmitriev
P.Yu. Apel

Deputy: V.A. Skuratov

Participating countries and international organizations:
Armenia, Australia, Belarus, Kazakhstan, Russia, Serbia, South Africa, Vietnam.

The problem under study and the main purpose of the research:
Experimental and theoretical studies of radiation tolerance of solids to heavy-ion impact, materials testing, controlled modification of materials properties and the development of new functional structures.

Projects in the theme:

	Name of the project	Project Leaders	Project code
1.	Radiation resistance of materials to high-intensity beams of heavy ions	V.A. Skuratov *Deputy:* R.A. Rymzhanov	07-5-1131-1-2024/2028
2.	Nanocomposite and functional track etched membranes	P.Yu. Apel *Deputy:* A.N. Nechaev	07-5-1131-2-2024/2028

Projects:

Brief annotation and scientific rationale:
The aim of the project is to accumulate a database for a better understanding of the fundamental laws of high-intensity ionization in model and structural materials. Knowledge of fundamental mechanisms is of considerable importance for nuclear power engineering, nanotechnology applications and for testing target materials for nuclear physics experiments. As an innovative approach, it is proposed to study the effects of dense ionization on a previously created defect structure, which was formed by exposure to “conventional” radiation (hundreds of keV and units of MeV, ion irradiation), which is the most reliable way to simulate damage produced by fission products.

The main approach to achieving the goals of the project will be the use of modern structural analysis techniques – high-resolution transmission electron microscopy in combination with molecular dynamics methods for modeling track formation processes. Structural changes will be also investigated using scanning electron microscopy, X-ray diffraction, confocal Raman and luminescence microscopy, and real-time optical spectroscopy under ion irradiation. The radiation resistance of promising reactor materials and target materials for nuclear physics experiments will be investigated by micro- and nanomechanical testing methods.

Expected results upon completion of the project:

1. Advanced understanding of the fundamentals of high-density ionization in solids, based on the studied dependencies of the kinetics of structural changes in the tracks of swift heavy ions in the near-surface areas of nanostructured dielectrics – nanoparticles, interfacial layers, layered structures.
2. Results of modeling by molecular dynamics methods of lattice relaxation processes and the formation of regions with a modified structure in the near-surface and interphase regions of composite materials exposed to energetic ions – nanoclusters in matrices, layered materials.
3. Data on the combined effect of dense ionization and helium on the transport properties of fission fragments in protective layers and inert matrices.
4. Accumulation of a database on the parameters of ion tracks in conventional and nanostructured ceramics promising for nuclear physics applications
5. Data on the long-term stability of target materials during prolonged irradiation with intense heavy ion beams.

Expected results of the project in the current year:

1. Investigation of the microstructure of the interface layers AlN/Al2O3, CeO2/ZrO2: Y, Si/Al2O3 irradiated with high-energy heavy ions by high-resolution transmission electron microscopy.
2. Measurement by TEM methods of the parameters of helium porosity in nickel- and titanium-based alloys uniformly ion-doped with helium and annealed.
3. Micromechanical nanoindentation testing of ferrite ODS alloys irradiated with high-energy xenon ions.

2.	**Nanocomposite and functional track etched membranes**	**P.Yu. Apel** *Deputy:* **A.N. Nechaev**

Brief annotation and scientific rationale:

The project's goal is to develop nanocomposite and functional track-etched membranes (TMs) for their applications in nanotechnology, biomedicine, sensor technologies, and novel membrane separation processes.

TMs are an example of the industrial application of ion-track technology. They have a number of significant advantages over conventional membranes due to their precisely determined structure. Their pore size, shape, and density can be varied in a controllable manner so that a membrane with the required transport and retention characteristics can be produced. The modern trends in biology, medicine, environmental research, green energy harvesting, and other areas formulate the demands for membranes with specific novel functionalities. These functionalities can be provided by tuning (setting) the geometry, morphology, and chemical properties of TMs. The present project will focus on the development of various functional track-etched membranes using the following approaches:

1. Tuning the pore architecture.
2. Composite structures.
3. Hybrid structures.
4. Targeted chemical and biochemical modification.
5. Selection of bulk material.

Special attention will be focused on biomedical applications of track-etched membranes. The main result of the project will be the creation of scientific and technical foundations for the development of new membranes with specific functions.

The applicability of the developed membranes in practically important membrane separation processes, biomedical procedures and analytical tasks will be investigated.

Expected results upon completion of the project:

1. Functionalized TMs obtained from ion-irradiated polymer films using soft photolysis and liquid extraction of degradation products from tracks for the electrodialysis and electro-baromembrane process:
   – determination of ion-selective properties of the membranes;
   – investigation of the possibility of mono- and multivalent-ion separation on nanoporous TMs using the electrodialysis and electro-baromembrane process.

2. Experimental verification of results on the possibility of manufacturing nanocomposite, functionalized, and hybrid TMs:
   – TMs with asymmetric and modified nanopores for the separation of racemic mixtures;
   – microfiltration TMs with immobilized proteins for the detection of free RNA and DNA and their use in biosensors;
   – functionalized nanoporous membranes made of polyvinylidene fluoride (PVDF) for selective preconcentration of toxic metals and their quantitative determination;
   – TMs functionalized with silver nanoparticles and bioactive substances for the creation of bactericidal and viricidal filtration materials;
   – modified TMs with improved cell adhesion for cell culture systems;
   affinity ultra- and microfiltration TMs for exosome separation;
   – nanocomposite TMs with immobilized silver and gold nanoconjugates and aptamers for the diagnosis of viral diseases using SERS and fluorescence spectroscopy;
   – hybrid TMs with surface polymer nanofiber structures and modified selective complex compounds, ligands and metal-organic frameworks for selective removal of toxic metals from water.

3. Data on ion-selective, electrokinetic, and osmotic properties of modified nanopores, including asymmetric nanopores, depending on their geometry and functional groups on the surface.

Expected results of the project in the current year:

1. Investigation of the patterns of track formation in polyvinylidene fluoride under heavy-ion irradiation and production of nanoporous PVDF TMs. Development of methods for modification of nanoporous PVDF TMs by functional monomers using postradiation graft polymerization
2. Production of track membranes functionalized by a layer of nanoparticles with a core/shell structure consisting of silver and gold for further use in the analysis of viruses employing aptamers
3. Study of the membrane distillation process using TMs with nanoscale hydrophobic coatings obtained by electron-beam dispersion of polymers.
4. Study of the selective properties of the metal-organic frame structure on the surface of TMs in electrolyte solutions.
5. Development of a method for modifying track membranes with biocompatible conjugates of curcumin and quercetin, as well as the evaluation of their biological effectiveness against RNA and DNA-containing viruses.
6. Development of a technique for baromembrane separation of the culture medium of human mesenchymal stem cells using TMs.

Physics and Technology of Charged Particle Accelerators (08)

08-2-1126-2015

Development of scientific DLNP infrastructure for research using semiconductor detectors, laser metrology, electrons, positrons and cryogenic technology

Theme leaders: V.V. Glagolev
G.A. Shelkov

Deputy: V.V. Tereschenko

Participating countries and international organizations:
Armenia, Azerbaijan, Belarus, Bulgaria, Czech Republic, Germany, Russia, Serbia, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:
In addition to the Projects highlighted below, the task of particular importance is the complete of commissioning of the basis facility of DLNP – the linear electron accelerator LINAC-200.

The main objectives of the research at the LINAC-200 linear electron accelerator for the upcoming 7-year period are:
– providing electron beams with energies of up to 200 MeV (with a possible increase in energy up to 800 MeV) for research and scientific and methodological work on the creation of detectors of elementary particles at JINR and in scientific centres of the member states for experiments at the NICA collider and other facilities, including those outside JINR;

– study of controlled generation of electromagnetic radiation by relativistic electrons based on the use of functional materials, search for new methods and creation of equipment for beam diagnostics in accelerators;

– carrying out research work on the creation of beams of relativistic electrons with a large orbital momentum;

– implementation of educational programmes of the JINR University Centre;

– conducting research, including applied studies in the field of radiation materials science, radiobiology, radiochemistry.

The expected operating time of the accelerator within the framework of the open user programme will be at least 2000 hours per year.

The goal of the project “Design and development of a test zone for methodological studies of detectors at the linear electron accelerator at DLNP” is to create an infrastructure based on the LINAC-200 for methodological studies using electron beams with energies from 20 MeV to 200 MeV.

Within the project “Precision laser metrology for accelerators and detector complexes”, the main objectives are to carry out scientific research and methodological studies on the development of Precision Laser Inclinometers for their application to scientific and applied tasks (monitoring the position of collider elements, improving the accuracy of measurements of Gravity antennas, earthquake forecasting); improvement of methods of metrological measurements; creation of a seismically isolated platform.

The goal of the project “Development of experimental techniques and applied research on monochromatic positron beams (PAS)” is to create a facility to study the structure of various materials and defects arising under various physical influences (aging, external loads, radiation exposure). One of the methods is positron annihilation spectroscopy (PAS). This method is sensitive to the detection of various (so-called “open-volume”) defects ranging in size from 0.1 to 1 nm with a minimum concentration of up to 10^{-7} cm^{-3}. The PAS method has four orders of magnitude better spatial resolution compared to the transmission electron microscope.

Under the project “New semiconductor detectors for fundamental and applied research”, the main goal is the development and methodological study of a new class of physical devices - hybrid pixel semiconductor detectors operating in the mode of counting individual particles. These devices first appeared at the turn of the 2000 s and differ from other pixel detectors by the ability to process and digitize the signal directly in the pixel, which makes it possible to obtain data on the energy of each particle falling into an individual pixel in addition to coordinate information.

Under the project “GDH & SPASCHARM & NN”: the introduction equipment operating at ultralow temperatures and polarized targets into the practice of physical experiment and conduct of polarization studies. Participation in innovative projects using cryogenic, magnetic and polarization technologies.

Projects in the theme:

	Name of project	Project Leaders	Project code
1.	Design and development of a test zone for methodological studies of detectors at a linear electron accelerator LINAC-200 in the DLNP	M.I. Gostkin *Deputies:* E.S. Abdelshakur	08-2-1126-1-2024/2028
2.	Presicion laser metrology for accelerators and detector complexes	V.V. Glagolev M.V. Lyablin	08-2-1126-2-2016/2028
3.	Development of experimental techniques and applied research with slow monochromatic positron beams (PAS)	A.A. Sidorin *Scientific leader:* I.N. Meshkov	08-2-1126-3-2016/2028
4.	Novel semiconductor detectors for fundamental and applied research	G.A. Shelkov *Deputy:* V.A. Rozhkov	08-2-1126-4-2015/2028
5.	GDH&SPASCHARM	Yu.A. Usov *Deputy:* Yu.A. Plis	08-2-1126-5-2011/2028

Projects:

	Name of the project	Project Leaders	Status
	Laboratory (Subdivision)	Responsible from laboratories	
1.	**Design and development of a test zone for methodological studies of detectors at a linear electron accelerator LINAC-200 in the DLNP**	**M.I. Gostkin** *Deputies:* **E.S. Abdelshakur**	Implementation
	DLNP	D.L. Demin, M.A. Demichev, A.S. Zhemchugov, V.G. Kruchonok, A.A. Nozdrin, S.Yu. Porokhovoy, D.V. Kharchenko	
	FLNR	S.V. Mitrofanov, Yu.G. Teterev	
	VBLHEP	V.V. Kobets	

Brief annotation and scientific rationale:
Scientific and methodological studies of elementary particle detectors are a necessary condition for the progress of nuclear physics and high energy physics. Preparation of experiments at future accelerators requires new types of detectors capable of coping with large loads and providing the required accuracy and reliability of particle detection. Development of new detectors is also important for applied research based on the use of synchrotron radiation sources and intense X-ray facilities. In particular, creation of new SR sources and super-powerful lasers in the JINR Member States leads to the creation of experimental stations based on detectors with high spatial and energy resolution.

The lack of facilities with test electron beams at JINR significantly slows down progress in development of new types of electromagnetic calorimeters and coordinate detectors for future MPD and SPD experiments at the NICA collider, photon imaging detectors, radiation-resistant detectors and dosimetric instruments. The purpose of the presented project is to create an infrastructure based on the linear electron accelerator LINAC-200 for methodological research on electron beams with an energy of 20 MeV and 200 MeV. It is planned to use a test area based on LINAC-200 and for conducting experiments on the study of photonuclear reactions, for applied research (radiation materials science, radiation genetics, etc.)

Expected results upon completion of the project:
As a result of the implementation of the project, an equipped test zone will appear at the LINAC-200 accelerator of DLNP JINR for carrying out scientific methodological and scientific experimental work by JINR groups and institutes of the JINR Member States.

Expected results of the project in the current year:
Measurement of electron beam characteristics (emittance, energy, focusing...) at energies of 20 and 200 MeV.
Launching a hodoscope based on MWPC.

Development a computer model of the test zone in GEANT4.

Study of dose measurement methods for biological and materials science purposes.

2. Presicion laser metrology for accelerators and detector complexes	**V.V. Glagolev** **M.V. Lyablin**	Implementation
DLNP	I.V. Bednyakov, S.A. Bednyakov, Bunyatov K.S., Yu.I. Davydov, Yu.V. Klemeshov, S.M. Kolomoets, A.V. Krasnoperov, A.M. Kuzkin, R.V. Ni, A.A. Pluzhnikov, K.D. Polyakov, G.D. Shirkov, S.N. Studenov, S.N. Shilov, G.T. Torosyan	
BLTP	A.N. Baushev	
GA&C	G.V. Trubnikov	

Brief annotation and scientific rationale:
The implementation of the project is aimed at long-term monitoring of the behaviour of the base of the collider (NICA) to track critical design changes that can cause beam deviations from the calculated orbits. Also, monitoring will make it possible to control angular vibrations of the collider elements from microseismic noise of industrial and natural origin in order to identify sources of noise and frequencies that coincide with the resonant frequencies of the collider elements, which can lead to a decrease in luminosity.

An equally important component of the project is development of a compact inclinometer capable of measuring changes in the angles of inclination of the surface with an accuracy of about 10^{-8} radians throughout the year, and further, building of a network of such inclinometers in seismic regions to determine energy accumulation zones and potentially seismic areas.

Expected results upon completion of the project:
Creation of a network of small-sized laser inclinometers (MPLIs) for monitoring the behaviour of the base of the collider (NICA) to track critical design changes that can cause beam deviations from the calculated orbits. Creation of a hardware-software complex for synchronization and processing of MPLI data. Creation of software for visualization of changes in the position of the Earth's surface under the NICA collider.

Modification of the current MPLIversion for long-term stable operation for 6-12 months with angular measurements accuracy of 10^{-7} rad at remote geodetic points, powered by solar panels.

R&D on a new version of the MPLI - an interferometric PLI (IPLI), which has a weak temperature dependence and less expensive production based on available components.

Based on the sets of modified MPLIs and IPLIs, carry out deployment of networks to determine the regions of seismic energy accumulation and monitor objects on the territory of Kamchatka, Armenia, Belarus and Uzbekistan.

Create the necessary software for receiving data from the PLI network, online control, visualization of the Earth's surface by a controlled network, algorithms (including machine learning, neural networks) for determining zones of increased accumulation of seismic energy.

Creation of a prototype of an amplitude interferometric length meter for a length of 16 m, creation of a prototype of a laser reference line for a length of 128 m, creation of a prototype of a seismically stabilized research platform, use of compact MPLIs to improve the frequency parameters of the gravitational antennas of the VIRGO detector.

Expected results of the project in the current year:
Complete research work on the creation of an Interference Precision Laser Inclinometer (IPLI).

Install the third MPLI at the point of beam ejection to the MPD hall of the NICA collider.

Install MPLI at the geophysical observatory Naroch in Belarus.

3. Development of experimental techniques and applied research with slow monochromatic positron beams (PAS)	**A.A. Sidorin** *Scientific leader:* **I.N. Meshkov**	Implementation
DLNP	E.V. Akhmanova, V.I. Hilinov, Nguyen Vu Minh Trung, O.S. Orlov, E.P. Popov, A.Yu. Rudakov, S.F. Samedov	
VBLHEP	V.V. Kobets, I.N. Meshkov	

Brief annotation and scientific rationale:
Applied research in the field of solids by PAS methods and the development of experimental techniques using these methods are among the goals of the project. To study defects in materials, the annihilation line Doppler broadening (DBAL) method is used, which is implemented on a flow of slow monochromatic positrons. The DBAL spectrometer is made according to the standard scheme. The Positron Annihilation Lifetime Spectroscopy (PALS) method implemented on an autonomous ^{22}Na source is also used. To develop the experimental base, the PALS method is being introduced on a flow of slow monochromatic positrons. The group proposed an original version of this method based on the formation of an ordered stream of slow positrons.

Expected results upon completion of the project:

1. Improvement of the DBAL spectrometer by adding to the measurement scheme the possibility of registering the coincidence of two annihilation gamma quanta.
2. Completion of the positron ordering system and commissioning of the PALS spectrometer on a monochromatic positron beam.
3. Development of the ion etching technique using the created etching system and its application to the study of thin-film multilayer materials.
4. There is a problem of high-temperature vacuum heating, which can be solved by heating samples with an electron beam. The available technical capabilities make it possible to implement this heating method.

Expected results of the project in the current year:

1. Continuation of applied research together with TPU, SAFU.
2. Applied research of radiation resistance of refractory materials.
3. Manufacturing and testing of the voltage generation system of the required shape on the resonator.

4. Novel semiconductor detectors for fundamental and applied research

G.A. Shelkov
Deputy:
V.A. Rozhkov

Implementation

DLNP	S. Abdelshakur, N.N. Kaurtsev, A.V. Lapkin, S.A. Malinin, R.V. Sotensky
FLNR	A.T. Isatov, S. Mitrofanov, Yu.G. Teterev
FLNP	A.A. Ahmedov, D. Berikov, Yu.N. Kopach
LRB	A.N. Bugay, A.V. Chizhov

Brief annotation and scientific rationale:

In 2015, topic 1126 was opened. The main goal of the work is the development and methodological research of a new class of physical devices – hybrid pixel semiconductor detectors operating in the single-particle counting mode. These devices first appeared at the turn of the 2000s. and differ from other pixel detectors by the ability to process and digitize the signal directly in the pixel, which makes it possible to obtain data on the energy of each particle falling into an individual pixel in addition to coordinate information.

The ability to detect and identify certain substances in certain parts of the human body provides crucial information about metabolic pathways, tissue components, and delivery mechanisms for these substances. This problem is of particular importance in the study of drug delivery. To carry out such studies using X-ray CT is currently difficult due to the lack of available detecting systems with high spatial resolution and capable of measuring the energy of gamma rays. The purpose of this project is to create a hardware and software basis for the development of detection systems with hybrid pixel detectors and X-ray diagnostic equipment based on them.

Expected results upon completion of the project:

The main direction of further work will be development of our own pixel chip and manufacture of new energy-sensitive semiconductor detectors of X-ray images and equipment for:

1. Creation of a hardware and software basis for the development of new types of radiographic devices for medical diagnostics, including computed tomography.
2. Improvement of methods for identifying substances in X-ray studies using data on the measured energy of gamma rays.

Expected results of the project in the current year:

1. Manufacturing and testing of the first samples of the developed chip.
2. Continuation of joint work with chemists of Moscow State University on the MARS microtomograph.

5. GDH&SPASCHARM	**Yu. Usov** *Deputy:* **Yu.A. Plis**	Implementation
DLNP	N.A. Bazhanov, D.V. Belov, N.S. Borisov, A.S. Dolzhikov, A.N. Fedorov, I.V. Gapienko, I.S. Gorodnov, V.L. Kashevarov, A. Kovalik, E.S. Kuzmin, A.B. Neganov, A.A. Priladyshev, A.B. Sadovsky, Yu.N. Uzikov, V.P. Volnykh	
BLTP	S.B. Gerasimov	
VBLHEP	V.V. Fimushkin, M.V. Kulikov, L.V. Kutuzova	

Brief annotation and scientific rationale:
1. Experimental study of one-spin asymmetries in the production of various light particles using a pion beam with an energy of 28 GeV at the first stage, and the study of one-spin and two-spin asymmetries in dozens of reactions, including those with the formation of charmonium, using a polarized proton beam (SPASCHARM project).

The ultimate goal of the SPASCHARM project is to study the spin structure of the proton, starting with determining the contribution of gluons to the spin of the proton at large values of the Björken variable x by studying the spin effects in the formation of charmonium. This will make it possible to understand the hadronic mechanism of charmonium production and to isolate the gluon polarization $\Delta g(x)$ at large values of x.

2. Experiments with a real photon beam: photoproduction of mesons on nucleons and nuclei and Compton scattering on nucleons. Main objectives: experimental confirmation of the Gerasimov-Drell-Hearn (GDH) sum rule, investigation of the helicity structure of partial reaction channels, resolution of the excitation spectrum of baryons from light quarks, search for missing baryon resonances and exotic states (dibaryons, narrow nucleon resonances), study of the structure of hadrons.

3. Measurement of $\Delta\sigma T$ and $\Delta\sigma L$ in an experiment on the transmission of polarized neutrons through a polarized deuteron target at neutron energies <16 MeV, where there are limited experimental data and where theory predicts a significant effect of three-nucleon forces (3NF). This part of the project (NN) is a continuation of measurements of the same quantities in the scattering of neutrons by protons, which were carried out earlier.

4. Research and development of polarization equipment for MESA.

To date, there is no theory that gives a complete and consistent description of all the observed polarization effects in the hadronic sector. Therefore, a systematic experimental study of polarization effects in a wide variety of reactions using polarized beams and polarized targets is of great importance for the development of a theory that consistently describes all the observed spin phenomena.

The observed polarizations are the paramount characteristics of the interactions of elementary particles and nuclear reactions. Formally, the measurement of spin-dependent parameters imposes additional restrictions on the proposed reaction mechanism, the structure of the microobject under study, and the very nature of the fundamental interaction. It should be noted that modern experiments aimed at searching for the effects of CP violation and T invariance violation outside the Standard Model, as well as CPT violation, are based on polarization measurements.

Expected results upon completion of the project:
Development and construction of a new cryostat for a polarized “frozen” target of the SPASCHARM installation.

Development and construction of the main components of a powerful 3He/4He dilution refrigerator for the “MESA” facility.

Completion of work on the creation of a cryostat for a polarized target at the University of Bonn.

Return transport and full launch of the polarized target in Mainz for the “GDH” project.

Carrying out polarization studies using a polarized “frozen” target at the “MAMI C” accelerator.

Carrying out polarization studies on a new polarized target at the Bonn University accelerator, “ELSA”.

Assembly, installation and testing of a powerful 3He/4He dilution refrigerator on the beam channel of the MESA setup.

Launch of the modified polarized target of the “SPASCHARM” facility and the beginning of the collection of physical statistics on the accelerator.

According to the NN-interaction program, channeling experiments will be carried out after the upgrade of the stand for the source of polarized deuterons, – 2024–2025.

Carrying out precise measurements of vector and tensor polarizations of the deuteron beam at the VdG accelerator.

Preparation of a special device for using a new target material based on trityl-doped butanol.

Manufacture and installation of equipment for measuring polarization of neutrons using scattering on a 4He target.

Depreservation of the polarized deuteron target and the beginning of measuring the difference between the cross sections ΔσT and ΔσL in the experiment on transmission of at neutron energies <16 MeV.

Expected results of the project in the current year:
Complete creation of a new cryostat for a polarized target at the University of Bonn.

Participation in the physical data taking at the ELSA accelerator.

Optimization of the polarized deuteron beam of the VdG Accelerator, Czech Technical University (Prague).

Advanced Studies of Systems of New-Generation Accelerators and Colliders for Fundamental and Applied Research

Theme leaders: G.V. Trubnikov
G.D. Shirkov
B.N. Gikal

Participating countries and international organizations:
Belarus, Belgium, CERN, China, Georgia, Germany, Italy, Moldova, Russia, Slovakia, South Africa.

The problem under study and the main purpose of the research:
Development of systems and elements of new generation accelerators at JINR, applied research at accelerators, JINR participation in the development of projects of international accelerator complexes, JINR participation in the development of the concept of establishment a pilot scientific and clinical center for proton therapy.

Project in the theme:

Name of the project	Project Leaders	Project code
1. Creation of test benches for testing individual systems of the MSC-230 cyclotron	G.A. Karamysheva S.L. Yakovenko	08-2-1127-1-2024/2024

Project:

Name of the project	Project Leaders	Status
Laboratory (Subdivision)	Responsible from laboratories	
1. Creation of test benches for testing individual systems of the MSC-230 cyclotron	**G.A. Karamysheva** **S.L. Yakovenko**	Development of prototype
DLNP	R.Galkin, V.A.Gerasimov, A.L. Gonshior, S.V. Gursky, S.N. Dolya, I.V. Evseeva, G.G. Kazakova, O.V. Karamyshev, I.N. Kiyan, O.E. Lepkina, O.V. Lomakina, I.D. Lyapin, V.A. Malinin, D.A. Malysh, D. Petrov, D.V. Popov, D.V. Rogozin, V.M. Romanov, A.A. Sinitsa, S.A. Fedorenko, G.M. Skripka, A.F. Chesnov, G.D. Shirkov, S.G. Shirkov	
VBLHEP	V.V. Borisov, D.N. Nikiforov, M.S. Novikov, G.G. Khodzhibagiyan	
MLIT	I.V. Amirkhanov, T.V. Karamysheva	

Brief annotation and scientific rationale:
In the coming years it is planned to create a prototype of the cyclotron and develop equipment for studying the Flash irradiation technique. The experience of joint development of the medical cyclotron SC200 in Hefei (Hefei, China) in the JINR ASIPP Collaboration (Hefei, China) will make it possible to create a source of intense proton beam, and the experience of conformal therapy treatment accumulated in the JINR Medical and Technical Complex LNR opens up possibilities to modernize the equipment for precise control and delivery of high dose rate for studies of the Flash therapy method.

The relevance of the project focused on modeling of the cyclotron and its systems is primarily due to the importance of creating an accelerator for proton therapy by the most modern methods, characterized by a unique beam intensity, as well as the relevance of medical and biological research to be carried out in the innovation center.

Creation of a superconducting proton cyclotron MSC-230 (together with NIIEFA (Rosatom State Corporation)). The cyclotron should provide a current of up to 10 μA with a proton energy of 230 MeV. MSC-230 may become the first model for a series of specialized medical accelerators of this type. The launch of MSC-230 is scheduled for end of 2024.

Expected results upon completion of the project:
A working prototype of a cyclotron with beam parameters sufficient for testing equipment and treating patients with modern methods of proton therapy.

Expected results of the project in the current year:
Study of the performance of individual cyclotron systems, in particular the test superconducting coil and proton source.

Activities:

Name of the activity Laboratory (Subdivision)	**Leaders** Responsible from laboratories	**Status**
1. Further development of methods, technologies, schedule modes and provision of radiotherapy	**G.V. Mitsyn**	R&D
DLNP	A.V. Agapov, I.V. Alexandrova, K.V. Belokopytova, V.M. Breev, G.V. Donskaya, V.N. Gaevsky, E.A. Gritskova, S.A. Gustov, I.I. Klochkov, A.G. Molokanov, S. A. Pisareva, A.V. Rzyanina, S.V. Shvidkiy, S.S. Uglova	
2. R&D of Photoinjecting systems	**M.A. Nozdrin**	Technical proposal Realization
VBLHEP	V.G. Shabratov, A.V. Shevelkin	

Expected results of the activity upon completion:
Research of various “transparent” photocathodes (primarily carbon-based), creation of a second beam on a photogun stand with a 213 nm laser, development of a photoinjector stand: increasing the electron energy to 150 keV, development of radiation safety, blocking and control systems.

Expected results of the activity in the current year:
Fabrication of the nanostructured carbon photocathodes and investigation of their electrophysical properties (λ = 213 / 266 nm). Assembling of the pepper-pot emittance measurement system main components for the photoinjector bench. Vacuum system assembling and pumping. Design, fabrication and assembling of a cryopump for the bench vacuum system. Assembling, tuning and calibration of the nanosecond range high-sensitivity electron bunch charge sensor prototype. Bench startup with the energy of 120 keV.

3. Participation in the development of the concept and joint project with FMBA of Russia for the creation of a pilot scientific and clinical center for proton therapy	**G.D. Shirkov**	Preparation of project
DLNP	S.G. Shirkov, S.L. Yakovenko	
VBLHEP	L.Yu. Stolypina	

Brief annotation and scientific rationale:
The Federal Medical and Biological Agency (FMBA) of Russia expressed its intention to take part together with JINR in the development of a joint concept (and in the future, a project) for the establishment of a pilot scientific and clinical center for proton therapy on the basis of the existing medical center No. 9 of the FMBA in Dubna and based on the MSC-230 accelerator being created at JINR. The objectives of the center will be development of modern methods and technologies of radiation therapy, medical technologies and diagnostics for the use of radiation therapy, advanced scientific research in the field of radiobiology, experimental irradiation and further treatment of patients.

Expected results of the activity upon completion:
Preparation of the project for establishment a proton therapy center.

Expected results of the activity in the current year:
Development of medical and technical conditions for the project of establishment a proton therapy center.

Analytical and Methodological Developments for the Organization of Scientific Research and International Cooperation in the Main Directions of JINR Development

Theme leaders: V. A. Matveev
S.N. Nedelko
O.-A. Culicov

Participating countries and international organizations:
Member States of JINR, states participating in JINR activities on the basis of bilateral agreements, international organizations.

The problem under study and the main purpose of the research:
Development of analytical materials concerning prospects of scientific research. Preparation of scientific research plans.

Development of science-organization and methodological materials for the special-purpose financing of research areas, themes and projects.

Development and application of information systems for the analysis of results of theoretical and experimental research.

Organization of international cooperation with the Member States of JINR, with states participating in JINR activities on the basis of bilateral agreements, and with scientific research institutions with which JINR has collaboration agreements.

Expected results in the current year:
1. Improvement of the organization and coordination of JINR scientific research work.
2. Analysis of the results of JINR activities for 2023 in the main research areas.
3. Update, administration and support of the electronic system for maintaining the Topical Plan for JINR Research and International Cooperation (Topical Plan). Preparation for the publication of the Topical Plan for the year 2025. Identification of JINR's priority research directions for 2025.
4. Development of JINR's grantmaking activities and participation in special-purpose programmes for financing scientific research in 2024.
5. Preparation of analytical materials for ministries and agencies.
6. Development and promotion of JINR's information resources on the Internet. Support of the system of accounting of protocols on scientific and technological cooperation.
7. Promotion of realization of JINR's right to independently confer academic degrees. Support of the operation of JINR's dissertational councils.
8. Preparation for the publication of the JINR Annual Report for 2023. Preparation of materials for the INIS system.
9. Scientific and organizational support and preparation of materials of JINR's governing and advisory bodies.
10. Prompt interaction with representatives of Member States and states participating in the activities of JINR on the basis of bilateral agreements in the fields of scientific research. Organization and holding of meetings of cooperation committees. Interaction with international organizations.
11. Organization and holding of contests for JINR Prizes, preparation of materials for nominating candidates for memberships in academies of sciences, for conferring honorary titles, for awarding medals and other decorations.

09-9-1139-2019

Scientific and Educational Programmes for the Training of Highly Qualified Personnel

Theme leaders: D.V. Kamanin
A.Yu. Verkheev

Participating Countries and International organizations:
Armenia, Azerbaijan, Belarus, Bulgaria, CERN, Cuba, Egypt, Kazakhstan, Moldova, Mongolia, Russia, Serbia, South Africa, Tunisia, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:
Development of the human resources training programmes at JINR aimed at further employment of the trainees as scientific and engineering specialists of the Institute is a key task, which includes work with various target audiences, including schoolchildren and school teachers.

For these purposes, the UC, together with the universities of the JINR Member States, creates appropriate conditions for students and PhD students from universities of the Member States to enable them to work on their qualification theses based on the research

conducted in the laboratories of the Institute, supports the activities of the JINR-based departments of the universities based in the country of the Institute's location, participates in the creation and development of network training programmes, trains students, PhD students, and interns on the basis of cooperation agreements with the universities of the JINR Member States and international organizations. An important part of the human resources programme is organization and running of international student practices and schools for young people from the Member States of the Institute; building and maintenance of the laboratory environment intended for hands-on training in scientific and engineering disciplines; support and further development of the system of training courses aimed at gaining or improving professional skills and qualifications of JINR technical and engineering personnel.

Development of the JINR outreach programme aimed at promotion of modern science achievements among school students and teachers, organization of excursions and online tours of the JINR main facilities; participation in science festivals, exhibitions, and forums promoting JINR; development of cooperation and communication with educational centres for school students; design and production of information materials for the JINR information centres, administration of the UC groups in the social media.

Expected results upon completion of the theme stages or projects:
1. Participation in the development of lecture courses and seminars for students and PhD students of the JINR-based departments of the Russian universities.
2. Training of students and PhD students at JINR on the basis of cooperation agreements with the universities of the JINR Member States and other countries.
3. Support and further development of the Engineering and Physics Training hands-on activities for students and PhD students from the JINR Member States and partner universities.
4. Support of the system of assigning Institute employees to JINR for preparation of their PhD theses without completing the academic programme of the PhD course. Participation in the Institute system of attestation of scientific personnel.
5. Organization and running of the JINR student programme "START", online programme "INTEREST", international student schools and practices.
6. Launch of the short-term Advanced Science Programmes for Young Researchers and Engineers "ASPYRE" at JINR.
7. Further development of the licensed system of training courses aimed at gaining or improving professional skills and qualifications of the technical and engineering personnel of the Institute.
8. Implementation of the advanced training programmes for school teachers from the JINR Member States.
9. Support of Dubna Interschool Physics and Mathematics Open Classroom and science programmes for school students, interaction with the Physics and Mathematics Lyceum named after Academician V.G. Kadyshevsky and other educational institutions.
10. Further development of the partner network of JINR information centres.
11. Organization and running of the JEMS programme.
12. Development of printed and electronic popular-science informational materials promoting the Institute and modern scientific achievements.

13. Provision of JINR partner universities and information centres in the Member States with electronic and printed informational materials.
14. Extension of the JINR partner network through further development of educational programmes.

Expected results in the current year:

1. Support and supervision of the educational process at the JINR-based departments of the Russian universities.
2. Support of the system of assigning young researchers to JINR laboratories for preparation of their PhD theses.
3. Organization and running of the International Student Practices in JINR Fields of Research for students of the JINR Member States' universities. Attraction of new countries for participation in the programme.
4. Organization and running of the JINR student programme “START” (summer and winter sessions) and online programme “INTEREST” (spring and autumn waves).
5. Test-running of the short-term Advanced Science Programmes for Young Researchers and Engineers “ASPYRE” at JINR.
6. Organization and running of joint scientific events and schools with partner universities at JINR.
7. Support and further development of an information system on the preparation of qualification theses by students and PhD students from universities of the JINR Member States in the Institute laboratories.
8. Organization and running of the Engineering and Physics Training hands-on activities for students and PhD students from the JINR Member States, further development of the existing laboratory works, development of laboratory works at LINAC-200. Further development of educational programmes on the accelerator arrangement and beam diagnostics.
9. Development of the language courses programme aimed at teaching Russian as a foreign language and English to JINR personnel.
10. Running of the training courses aimed at gaining or improving professional skills and qualifications of the technical and engineering personnel of the Institute.
11. Organization of scientific schools for physics teachers from the Institute Member States at JINR.
12. Further development of educational programmes for high school students from the partner countries of JINR.
13. Further development of virtual tours of JINR main facilities and video-conferences with educational institutions of the JINR Member States. Organization and guidance of group visits to JINR for school and university students.
14. Promotion of modern educational resources in the JINR Member States.
15. Organization of the participation of JINR in science festivals on the basis of Russian universities.
16. Further development of the partner network of JINR information centres.
17. Organization and running of the JEMS programmes in accordance with the international cooperation plan.

Brief annotation and scientific rationale:

The integration of science, education and the achievements of modern technologies is becoming especially important as one of the most important factors for the development of the economy and the social structure of a society based on knowledge-intensive technologies. To solve these tasks, it is necessary to combine the efforts of various universities and research centers to create new training courses and research practices.

Multimedia and interactive methods, combined with real data obtained in one of the research centers, could largely solve this problem. The Joint Institute for Nuclear Research, as an international organization, under whose auspices the participating states, associate members and dozens of collaborating universities from around the world, offers its solution to this problem in the form of the implementation of the project “Open information and educational environment for supporting fundamental and applied multidisciplinary research at JINR”

Project purposes:

1. The use of modern educational technologies for the preparation of university students and advanced training of specialists for work at JINR.
2. Attracting talented young people from the participating countries and countries cooperating with JINR to participate in research projects of the Institute.
3. Implementation of the results in the field of fundamental and applied research obtained at JINR into the educational process in the member countries and associate members of JINR. Expanding the geography of cooperation.
4. Cooperation with the world’s leading scientific centers and universities in the field of creating educational resources for physics teachers and high school students.
5. Increasing the awareness of fundamental and applied multidisciplinary research conducted at JINR and the JINR brand among a wide audience. Placement of courses prepared by leading JINR specialists on international platforms of open education.
6. Creation of educational and exhibition content on JINR topics at the level of leading scientific centers.

Expected results upon completion of the project:

1. Information support of the main areas of fundamental and applied research at JINR.
2. Creation of online courses and new educational programs on the subject of the Institute's activities on modern educational platforms.
3. Development of a project to create virtual, remote and laboratory practicums for the study of nuclear physics and applied research.
4. Development of exhibition activities about the achievements of JINR and modern science in the Russian Federation and countries cooperating with JINR.
5. Creation of multimedia resources and web solutions to support JINR information centers.
6. Creation of electronic educational materials and research laboratory practicums for schoolchildren to study physics and biology at an advanced level in schools of the Russian Federation and partner countries.

Expected results of the project in the current year:

1. Creation and development of an information system for supporting applied research at the NICA accelerator complex (ARIADNA project).
2. Creation and development of a web-based knowledge base on low energy nuclear physics "Nuclear Reaction Video 2.0".
3. Conclusion of an agreement on cooperation with NRNU MEPhI in the field of creating online courses in nuclear physics, engineering, atomic and related technologies and their further publishing at the educational portals of JINR (edu.jinr.ru) and NRNU MEPhI (online.mephi.ru).
4. Creation of an exhibition item – a full-scale model of the NICA collider magnet using real equipment components and augmented reality (AR) elements.
5. Development of a virtual practicum on radiobiology for working with an electron microscope on the example of the study of microfossils and organic compounds in meteorites and in ancient terrestrial rocks.
6. Development of a platform for remote practicums together with iThemba LABS.
7. Development of hands-on practicums and new virtual laboratory works on nuclear electronics and the basics of detection of ionizing particles.
8. Organizing practices and workshops for university students.
9. Development of the JINR – iThemba LABS Corner exposition. Creation of a series of videos on the basics of experimental nuclear physics for schoolchildren for the JINR – iThemba LABS Corner exposition.
10. Creation of electronic educational materials for the study of physics at advanced level in grades 7–9 for the training of future engineers (project "Physics 7–9. Engineers of the Future").
11. Creation of electronic educational materials for the elective course "Nuclear Physics" for a specialized school, including research practicums in nuclear physics (hands-on, virtual and remote).

Dubna International Advanced School of Theoretical Physics (DIAS-TH)

Theme leader: I.G. Pirozhenko

Rector of DIAS-TH: D.I. Kazakov

Participating Countries and International organizations:
Armenia, Czech Republic, Russia, Serbia.

The problem under study and the main purpose of the research:
The Dubna International Advanced School of Theoretical Physics (DIAS-Th) is a scientific and educational project aimed, firstly, at training senior students, post-graduate students and young scientists on research topics of the Laboratory of Theoretical Physics, priority scientific areas of JINR research and modern areas of physics. The second goal of the project is to expand international cooperation and attract young scientists from Russia and the participating countries to JINR.

Brief annotation and scientific rationale:
The Dubna International Advanced School of Theoretical Physics (DIAS-Th) is a scientific and educational project that has successfully been developing at the N.N. Bogolyubov Laboratory of Theoretical Physics since 2003.
The project is aimed, firstly, at training senior students, post-graduate students and young scientists on research topics of the Laboratory of Theoretical Physics, priority scientific areas of JINR research and modern areas of physics. For this purpose, schools of various levels are regularly held for students, postgraduates and young scientists from the JINR Member States and other countries, and lectures are published. In addition, review lectures on problems of modern physics are organized for JINR staff. Both researchers of JINR Laboratories and internationally recognized scientists from scientific centers of the Russian Federation and foreign scientific centers are involved in giving lectures. Lectures given by the world's leading experts at DIAS schools stimulate the emergence of new areas of research at BLTP. The project provides in-depth training in the field of modern theoretical and mathematical physics. To this end, the project participants cooperate with the JINR University Center, as well as with the JINR-based Departments at Dubna State University, Moscow Institute of Physics and Technology, Moscow State University.

Secondly, the project is aimed at dissemination of scientific knowledge, namely, informing schoolchildren and people who are not professionally engaged in science about the achievements of modern theoretical physics, in particular, about current research at BLTP. In addition, one of the objectives of the project is to encourage young scientists to cooperate with BLTP JINR.

Expected results upon completion of the project:
Within the framework of the project "Dubna International School of Modern Theoretical Physics", in educational activities it is supposed to organize regular schools on JINR priority topics and modern scientific areas for schoolchildren, students, post-graduate students and young scientists from the JINR Member States and other countries; to carry out review lectures on problems of modern physics for JINR staff; to continue/renew cooperation with scientific organizations of the Russian Federation and foreign scientific organizations, higher educational institutions in educational activities; to participate in the educational activities at the JINR-based departments of Moscow State University, MEPhI, MIPT, Dubna State University together with the JINR University Center; to organize schools for students, graduate students and young scientists in cooperation with the Moscow Institute of Physics and Technology, Yerevan Institute of Physics, etc.; to take part in international scientific and educational projects.

In the dissemination of physical knowledge, it is planned to collabotate with other projects promoting popular science, such as Post Nauka, with foundations of the Russian Federation (Science Foundation of the Russian Federation, Federal Target Programs) and international foundations in organizing and conducting international schools for students, graduate students and young scientists.

It is also planned to support the DIAS-TH website, to provide video broadcasting of lectures, to record the video of lectures, and to support the digital archive of DIAS-TH.

Expected results of the project in the current year:
1. Organization at BLTP of three schools on theoretical physics for students, post-graduates and young scientists:
– Winter school "Physics of multi-particle systems" (Chair of the Organizing Committee O.V. Teryaev)

– International Summer School "Advanced Methods of Modern Theoretical Physics: Integrable and Stochastic Systems" (Chair of the Organizing Committee M. Hnatic)

– International Summer School "Nuclear Theory and Astrophysical Applications" (Chair of the Organizing Committee N.V. Antonenko)

2. Organization of one-day lectures/discussions and regular seminars for students and post-graduates and JINR researchers.

3. Computer processing of video records of lectures, support of digital archive of video records.

4. Support of Web-site of DIAS-TH.
